1 Version History

Version	
1.3	API documentation for SW version v.1.0.3 (Build 43)
2.0	API documentation for v.1.1.0 beta (Build 46)
2.1	API documentation for v.1.1.0 beta (Build 55) Note: API changes history is now included here (not separate) Changed APIs: * Attribute Database – User Read Response (function implemented for Beta 2) * Connection – Connection Status Flags (fixed) Doc improved for following APIs: * Attribute Client – Attribute Value, Indicated, Procedure Completed, Group Found * Attribute Database – User Read Request * Generic Access Profile – Discover, Set Adv Parameters * Hardware – I2c Read, I2c Write, Set Soft Timer, Set Txpower * Security Manager – Delete Bonding, Get Bonds * System – Whitelist Append Other sections (outside API reference) has also been updated to improve the document
2.2	Added documentation how to use BGAPI protocol without UART flow control. Section updated: BGAPI protocol definition
2.3	API documentation for v1.1.0 (Build 71+) * Various typos and wording corrected.

2 Introduction to Bluetooth Smart SDK

Bluegiga's *Bluetooth* Smart SDK suite provides a complete development framework for *Bluetooth* low energy application developers.

The *Bluetooth* Smart SDK supports two architectural modes:

- **Standalone architecture**: All software including: *Bluetooth* 4.0 single mode stack, profiles and end user application all run on the Bluegiga's *Bluetooth* 4.0 single mode hardware.
- **Hosted architecture**: The *Bluetooth* 4.0 single mode stack and profiles run on the Bluegiga 4.0 single mode hardware but the end user application runs on a separate host (a low power MCU).

The benefit of the *Bluetooth* Smart SDK in both use cases is that it provides the user with a complete *Bluetooth* 4.0 single mode stack, so that no *Bluetooth* protocol development is required. A well-defined transport protocol exists between the host and the *Bluetooth* 4.0 stack and also simple development tools are available for embedding the end user applications on the *Bluetooth* 4.0 single mode hardware.

The *Bluetooth* Smart SDK suite consists of several components:

- A *Bluetooth* 4.0 single mode stack
- Binary based communication protocol (BGAPI) between the host and the *Bluetooth* stack
- A C library (BGLib) for the host that implements the BGAPI protocol
- BGScript scripting language and interpreter for implementing applications on the *Bluetooth* Smart mode hardware
- A Profile Toolkit for quick and easy development of GATT based *Bluetooth* services and profiles

2.1 *Bluetooth* 4.0 single mode stack

The *Bluetooth* 4.0 single mode stack is a full, embedded implementation of *Bluetooth* v.4.0 compatible stack software and it's dedicated for Bluegiga's *Bluetooth* 4.0 single mode modules such as the BLE112. The stack implements all mandatory functionality for a single mode device. The structure and layers of the stack are illustrated in the figure below.

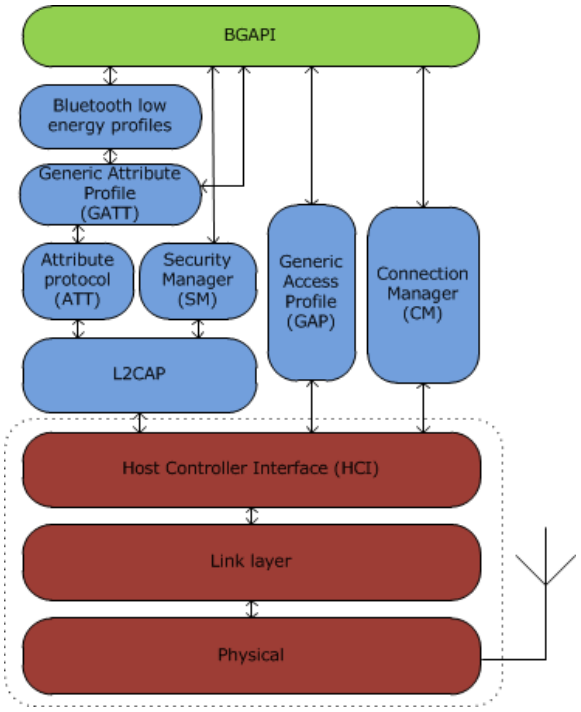

Figure 1: Bluetooth low energy single mode stack

Copyright © 2001-2012 Bluegiga Technologies

2.2 BGAPI protocol

For applications where a separate host (MCU) is used to implement the end user application, a transport protocol is needed between the host and the *Bluetooth* stack. The transport protocol is used to control with the *Bluetooth* stack as well to transmit and receive data packets. This transport protocol is called BGAPI and it's a binary based communication protocol designed specifically for ease of implementation within host devices with limited resources.

The BGAPI provides access to the following layers:

- **Generic Access Profile** - GAP allows the management of discoverability and connetability modes and open connections
- **Security manager** - Provides access the *Bluetooth* low energy security functions
- **Attribute database** - An class to access the local attribute database
- **Attribute client** - Provides an interface to discover, read and write remote attributes
- **Connection** - Provides an interface to manage *Bluetooth* low energy connections
- **Hardware** - An interface to access the various hardware layers such as timers, ADC and other hardware interfaces
- **Persistent Store** - User to access the parameters of the radio hardware and read/write data to non-volatile memory
- **System** - Various system functions, such as querying the hardware status or reset it

The BGAPI protocol is intended to be used with:

- a serial UART link or
- a USB connection

2.3 BGLib library

For easy implementation of the BGAPI protocol a host library is available refer as BGLib. This library is easily portable ANSI C code delivered within the *Bluetooth* Smart SDK. The purpose is to simplify the application development to various host environments.

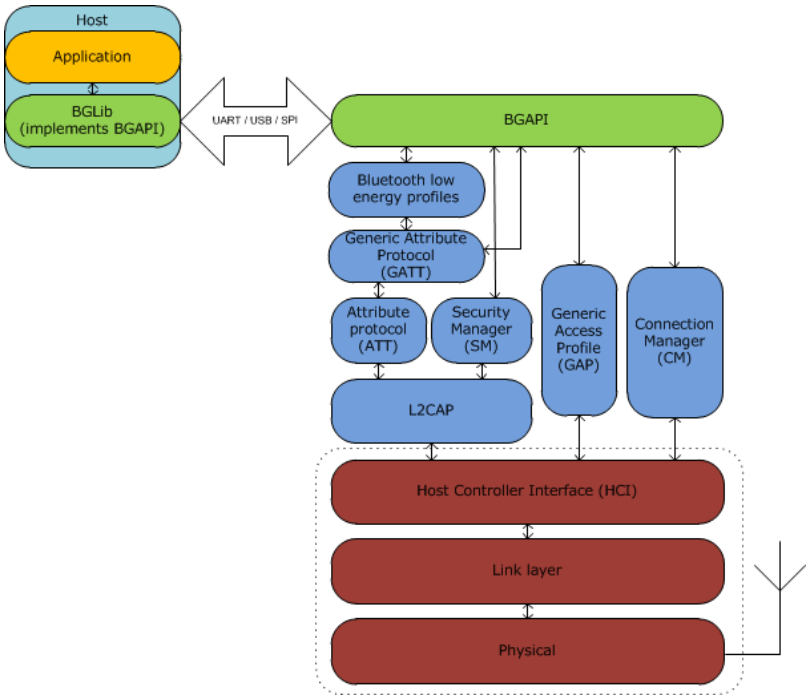

Figure 2: Host using BGLib

Copyright © 2001-2012 Bluegiga Technologies

2.4 BGScript scripting language

Bluegiga's *Bluetooth* Smart mode products allow application developers to create standalone devices without the need of a separate host. The *Bluetooth* Smart modules can run simple applications along the *Bluetooth* 4.0 single mode stack and this provides a benefit when one needs to minimize the end product size, cost and current consumption. For developing standalone *Bluetooth* Smart applications the development suite provides a simple BGScript scripting language. With BGScript provides access to the same software and hardware interfaces as the BGAPI protocol. The BGScript code can be developed and compiled with free tools provided by Bluegiga.

When the BGScript approach is used the BGAPI host interface is not needed nor is it available.

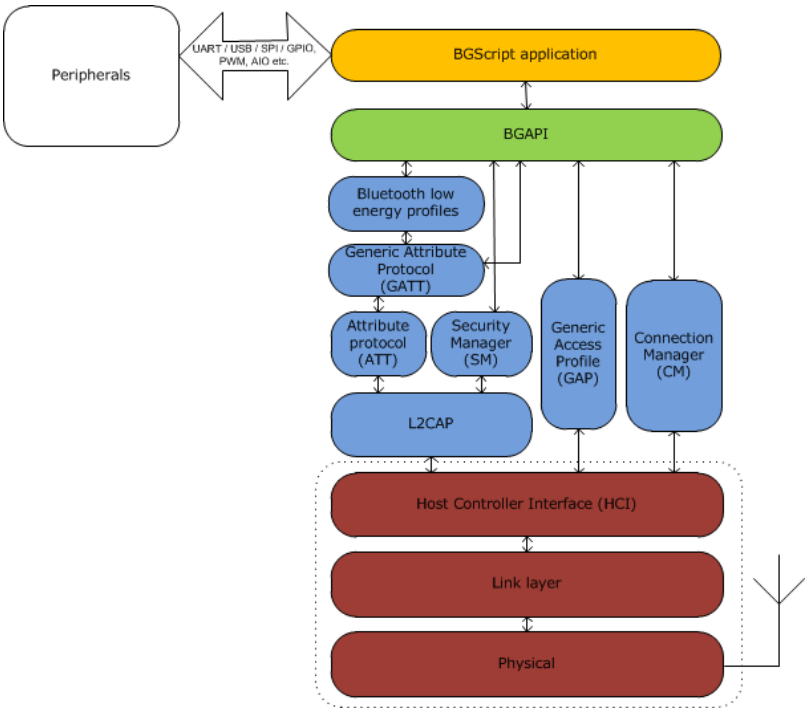

Figure 3: Standalone application model

A BGScript code example:

```
# System Started
event system_boot(major, minor, patch, build, ll_version, protocol_version,
hw)

  #Enable advertising mode
  call gap_set_mode(gap_general_discoverable,gap_undirected_connectable)

  #Enable bondable mode
  call sm_set_bondable_mode(1)

  #Start timer at 1 second interval (32768 = crystal frequency)
  call hardware_set_soft_timer(32768)
end
```

2.5 Profile Toolkit

The *Bluetooth* low energy profile toolkit a simple set of tools, which can used to create GATT based *Bluetooth* services and profiles. The profile toolkit consists of a simple XML based service description language template, which describes the devices local GATT database as a set of services. The profile toolkit also contains a compiler, which converts the XML to binary format and generates API to access the characteristic values.

```
<?xml version="1.0" encoding="UTF-8" ?>
<configuration>

    <service uuid="1800">
      <description>Generic Access Profile</description>

      <characteristic uuid="2a00">
        <properties read="true" const="true" />
        <value>BGDemo sensor</value>
      </characteristic>

      <characteristic uuid="2a01">
        <properties read="true" const="true" />
        <value type="hex">4142</value>
      </characteristic>
    </service>

</configuration>
```

Figure 4: A profile toolkit example of GAP service

3 Introduction to Bluetooth Smart

This section gives a quick introduction to *Bluetooth* Smart technology and its most important features. The chapter does not contain complete detailed technology walkthrough but gives developers more insight into the technology and to help them develop *Bluetooth* Smart applications.

3.1 Physical layer

The features of physical the layer in *Bluetooth* low energy are:

Feature	Value
Frequency band	2.4GHz (2402Mhz - 2480MHz
Modulation	GFSK, 1 Mbps
Modulation index	0.5
Channel spacing	2 MHz
Advertising channels	3
Data channels	37
Frequency hopping	Adaptive FHSS

The requirements for the *Bluetooth* low energy radio are:

Feature	Value
Minimum TX power	0.01mW (-20 dBm)
Maximum TX power	10 mW (10 dBm)
Minimum RX sensitivity	-70 dBm (BER 0.1%)

The typical range for *Bluetooth* low energy radios is:

TX power	RX sensitivity	Range
0 dBm	-70 dBm	~30 meters
10 dBm	-90 dBm	100+ meters

The figure below illustrates the link layer channels. There are 37 data channels and 3 advertisement channels.

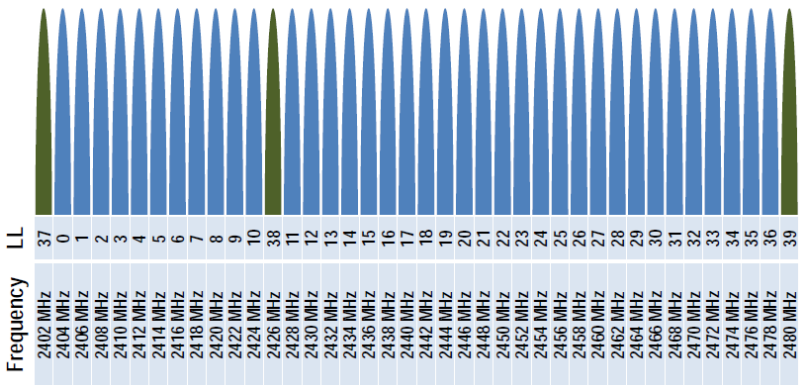

Figure 5: Link layer channels

Copyright © 2001-2012 Bluegiga Technologies

3.2 Packet format

3.2.1 Generic packet format

Bluetooth low energy has one generic packet format used for both advertisement and data packets.

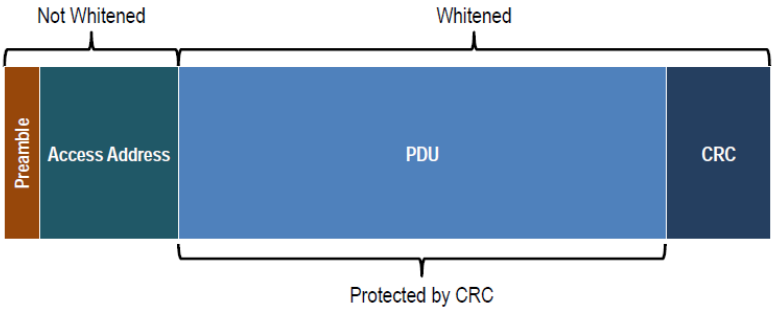

Figure 6: Generic packet format

- **Preamble:** either 010101010 or 101010101
- **Access address:** advertisement packets use a fixed access address of 0x8E89BED6. Data packets use a random access address depending on the connection.
- **PDU:** protocol data unit depends on the packet type.
- **CRC:** a 24-bit CRC checksum is used to protect the PDU.

3.2.2 Advertisement packet format

The advertisement packets use the following structure and can contain 0 to 31 bytes of advertisement data.

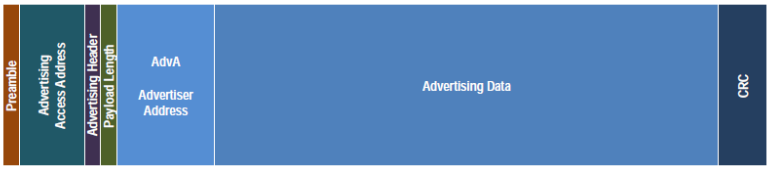

Figure 7: Advertisement packet structure

3.2.3 Data packet format

The data packets on the other hand use the following structure. An unencrypted data packet can have 0 to 27 bytes of payload.

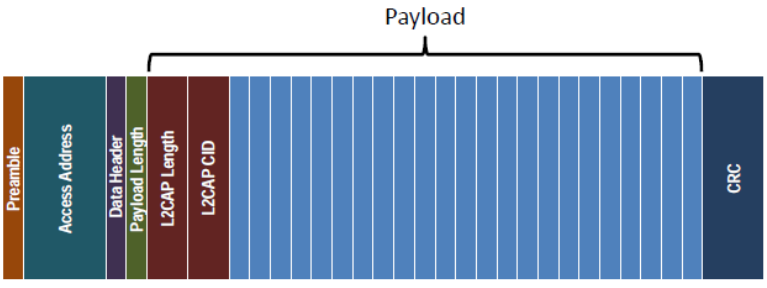

Figure 8: Unencrypted data packet

Copyright © 2001-2012 Bluegiga Technologies

An encrypted data packet can have 0 to 31 bytes of payload length, but MIC (Message Integrity Check) is part of it.

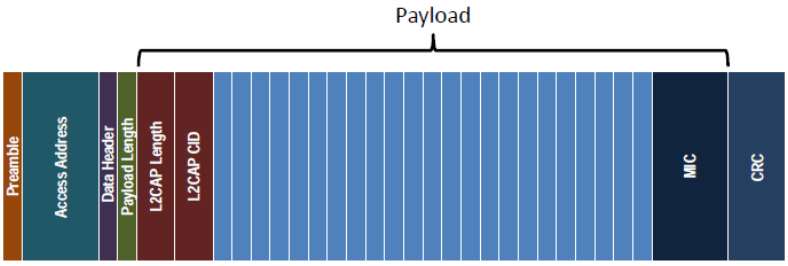

Figure 9: Encrypted data packet

Copyright © 2001-2012 Bluegiga Technologies

3.3 Link layer state machine

The *Bluetooth* low energy link layer state machine and state transitions are illustrated in the figure below.

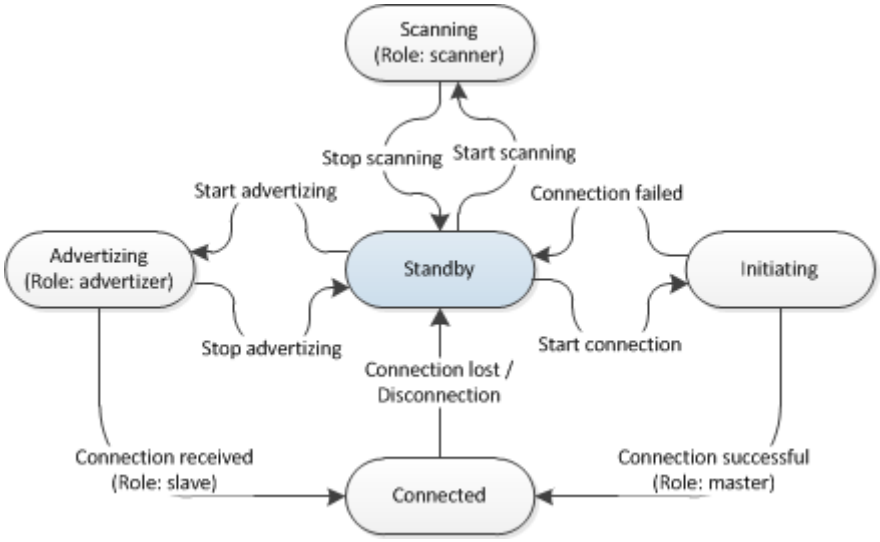

Figure 10: Link layer state machine and state transitions

Copyright © 2001-2012 Bluegiga Technologies

3.4 Link layer operations

This section describes the *Bluetooth* low energy link layer operations.

3.4.1 Passive scanning

In passive scanning mode the advertiser simply broadcasts advertisement packets and a scanner and listen to incoming advertisements.

Typically in passive scanning scenario:

- Advertiser sends three advertisement packet one on each advertisement channel separated by 150us.
- Scanner only listens to one advertisement channel at a time, but keeps switching between the three advertisement channels.

The advertisement events are separated by a time called advertisement interval, which can vary from 20ms to 10240ms. On addition a random delay is added to the advertisement interval to avoid interference with other devices.

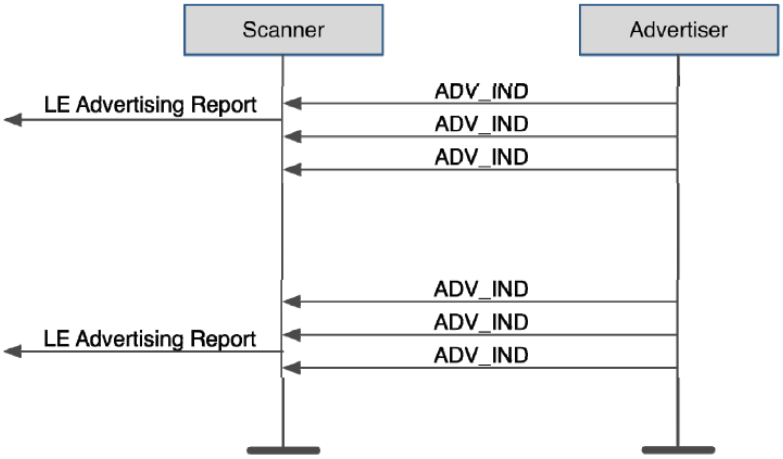

Figure 11: Passive scanning

The advertisement packets typically contains information like:

- Discoverability and connectability modes
- The address of advertiser
- TX power level
- Supported services
- Application data

3.4.2 Active scanning

In active scanning mode the scanner will request more information from the Advertiser after it has received an advertisement packet.

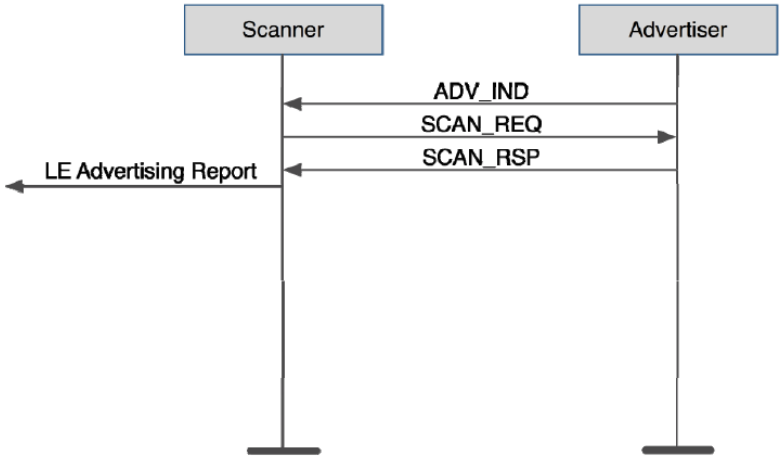

Figure 12: Active scanning

The scan response packets typically contains information like:

- Device friendly name
- Supported services (profiles)

3.4.3 Connection establishment

The figure below illustrates how the connection establishment happens at the link layer level.

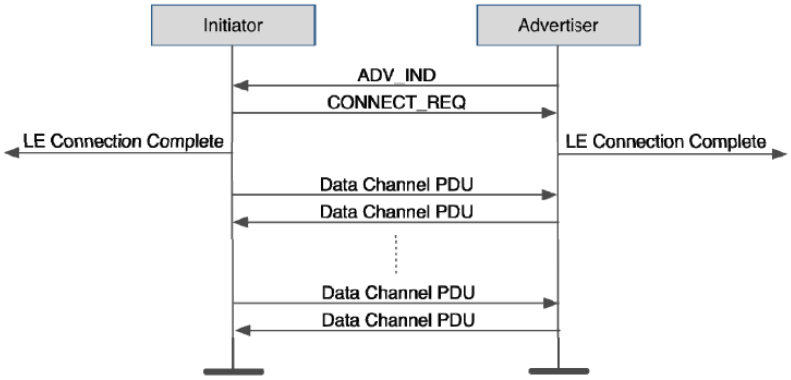

Figure 13: Bluetooth low energy connection establisment

Copyright © 2001-2012 Bluegiga Technologies

3.5 Topologies

Bluetooth low energy has four device roles: advertiser, scanner, master and slave. The technology supports point-to-point and start topologies. The figure below illustrates the device roles, and topologies.

- **Advetiser** : Broadcasts advertisement packets, but is not able to receive them
- **Scanner :** Listens for advertisement packets sent out by advertisers. Can try to connect an advertiser.
- **Master :** A device that is connected to one or several slaves
- **Slave :** A deivce that is connected to a master. Can only be connected to one master at a time

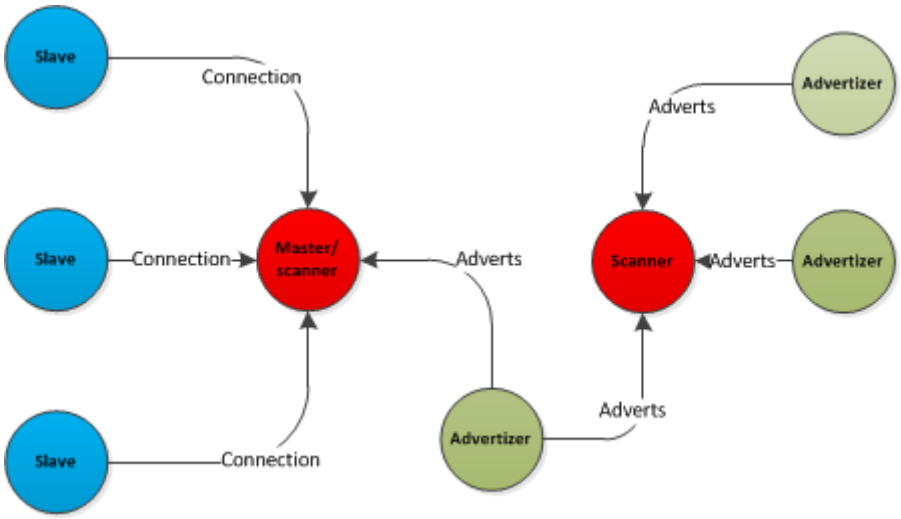

Figure 14: Bluetooth low energy topologies

Devices can change roles and topologies as illustrated below.

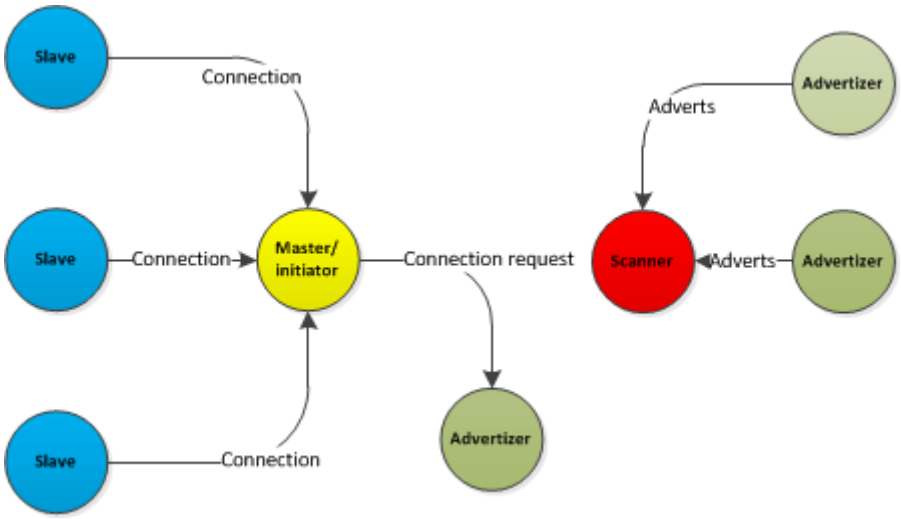

Figure 15: Topology and role change

Copyright © 2001-2012 Bluegiga Technologies

3.6 Connections and packet timings

Connections allow application data to be transmitted reliably and robustly. The data sent in a connection can be acknowledged, integrity is protected by CRC and to protect privacy the data can also be encrypted. On addition the Adaptive Frequency Hopping (AFH) guarantees reliable data transmission even in noisy environments.

In *Bluetooth* Smart technology the connection procedures are very simple and connections are always starts when master sends a connection request packet to the slave. The connection request packet can only be sent right after a successful reception of an advertisement packet. The connection request packet contains the following information:

Parameter	Description
Conn_Interval_Min	Minimum value for the connection event interval **Range: 7.5 ms to 4000ms**
Conn_Interval_Max	Maximum value for the connection event interval **Range: 7.5 ms to 4000ms** Shall be greater then Conn_Interval_Min
Conn_Latency	Slave latency for the connection in number of connection events. Slave latency allows the slave devices to skip a number of connection events in case it does not have any data to send. **Range: 0 to 500**
Supervision_Timeout	Supervision timeout **Range: 100ms to 32 seconds** Shall be greater than Connection Interval

The connection parameters can be updated during the connection.

The connection timeline and events are illustrated below.

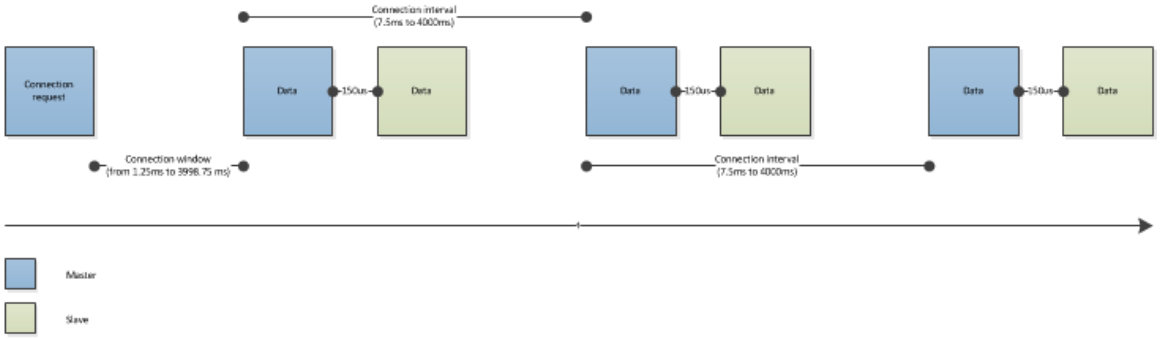

Figure 16: Bluetooth LE connection

The connection event starts, when master sends a packet to the slave at the defined connection interval. The slave can respond 150us after it has received a packet from the master. However if the slave has no data to send it can skip a certain number of connection events defined by the slave latency parameter. If no packets are received by the master or slave within the time defined by the supervision timeout, the connection is terminated.

If the slave has more data to send than what can be fitted into a single packet, the connection event will automatically extend and the slave can send as many packets as there is time until the beginning of next connection interval. This however can only be used with attribute protocol operations, that do not require an acknowledgement.

Copyright © 2001-2012 Bluegiga Technologies

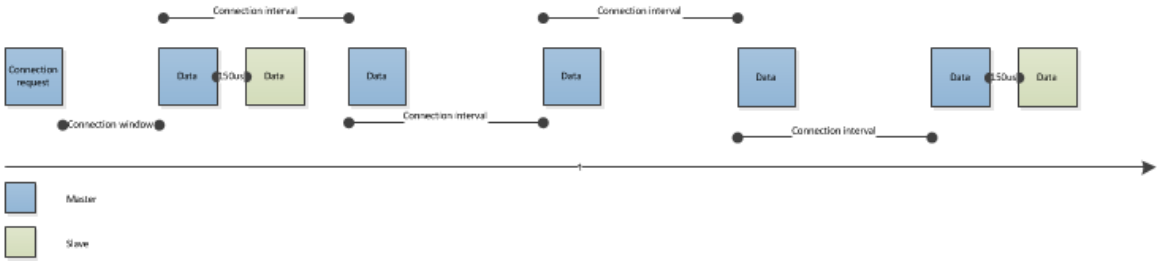

Figure 17: Slave latency in function (latency=3)

Copyright © 2001-2012 Bluegiga Technologies

3.7 Encryption

Bluetooth low energy uses AES-128 link layer encryption block with Counter Mode CBC MAC (defined in RFC 3610).

The data packets are encrypted as show below.

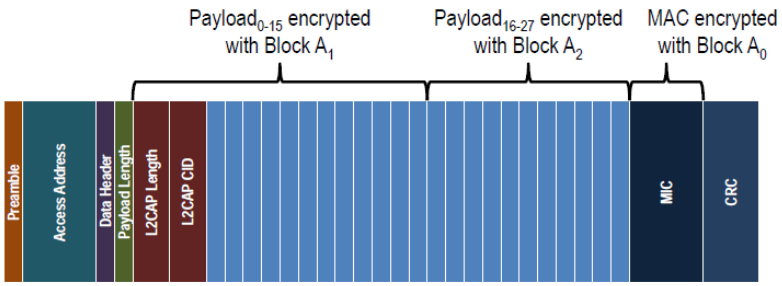

Figure 18: Encrypted data packet

The full AES encryption procedure is illustrated below.

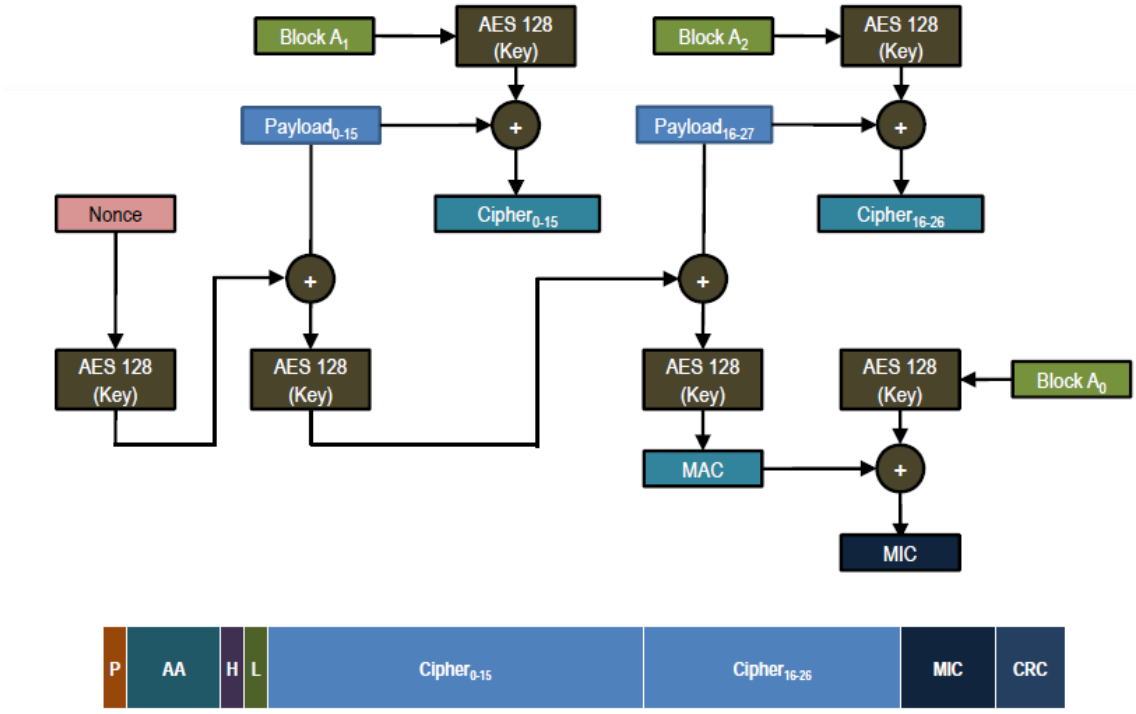

Figure 19: AES encryption procedure

Limitations of link layer encryption

- Maximum 2^39 packets per Long Term Key (LTK)
  - 13.7 TB of data / connection
  - ~12 years at maximum data rate

Copyright © 2001-2012 Bluegiga Technologies

3.8 L2CAP

L2CAP stands for Logical Link Control and Adaptation Protocol and it is acts as a protocol multiplexer and handles segmentation and reassembly of packets. It also provides logical channels, which are multiplexed over a or more logical links.

All application data is sent over L2CAP packets and the L2CAP structure is illustrated below.

Figure 20: L2CAP packet format

The following CIDs are defined:

CID	Description	Notes
0x0000	Null identifier	Not used
0x0001	L2CAP Signaling Channel	BR/EDR only
0x0002	Connectionless Channel	BR/EDR only
0x0003	AMP Manager Protocol	BR/EDR only
0x0004	Attribute Protocol	LE only
0x0005	LE L2CAP Signaling Channel	LE only
0x0006	Security Manager Protocol	LE only

Copyright © 2001-2012 Bluegiga Technologies

3.9 Security Manager

The security manager protocol is responsible of:

- Pairing
- Key distribution
- Generating hashes and short term keys

The security manager uses asymmetric model and more responsibility is given to the master device, so the memory and processing requirements on the slaves can be kept to minimum.
The basic security manager concepts include:

- **Distributing key model**
  Slave generates and distributes key information to master
  Master can use this key information when reconnecting

- **Pairing**
  Authentication of devices based on their capabilities and security requirements

- **Signing Data**
  Signing allows authentication of sender without encryption

- **Bonding**
  GAP concept – device save keys for bonded devices

Three pairing methods are supported:

- Just works pairing, similar to *Bluetooth* 2.1 + EDR
- Man-in-the-Middle pairing using a passkey entry or comparison, similar to *Bluetooth* 2.1 + EDR
- Out-of-band pairing, where security keys are exchanged over an other medium like NFC

I/O capabilities and Man-in-the-Middle (MITM) protection

Same I/O capabilities and MITM features are supported as in *Bluetooth* 2.1 + EDR.

	No Input	Yes / No	Keyboard
No Output	No Input No Output	No Input No Output	Keyboard Only
Numeric Output	Display Only	Display Yes No	Keyboard Display

Figure 21: I/O capabilities

Copyright © 2001-2012 Bluegiga Technologies

3.10 Attribute Protocol (ATT)

Bluetooth low energy profiles expose a state of a device. The state is exposed as one or several values called attributes and the protocol to access these attributes is called the Attribute protocol (ATT).

The attribute protocol uses a client server architecture and has two roles:

- **Server**
  Service is the device that exposes the information as one or several attributes
- **Client**
  Client device that collects the information for one or more servers

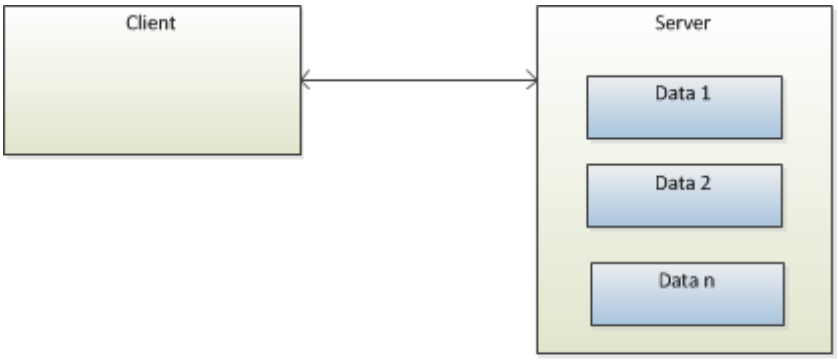

Figure 22: Device roles

Attribute types:

Attributes are values:

- Arrays of octets
- From 0 to 512 octets
- Can be fixed or variable length

Example:

Value
0x0000
0x426c7565676967612054656368e6f6c6f67696573

Attribute have handles, which are used to address an individual attribute. The client accesses the server's attributes using this handle.

Example:

Handle	Value
0x0001	0x0000
0x0002	0x426c7565676967612054656368e6f6c6f6769657

Attributes also have a type, described by a UUID. UUID determines what the attribute value means.

Copyright © 2001-2012 Bluegiga Technologies

Two types of UUIDs are used:

- Globally unique 16-bit UUID defined in the characteristics specifications (http://developer.bluetooth.org/)
- Manufacturer specific 128-bit UUIDs, which can for example be generated online. (http://www.uuidgenerator.com/)

Example:

Handle	UUID	Value	Description
0x0001	0x1804	0x0000	TX power as dBm
0x0002	0x2a00	0x426c7565676967612054656 3686e6f6c6f6769657	Device name, UTF-8

Attribute permissions:

Attributes also have permissions, which can be:

- Readable / Not readable
- Writable / Not writable
- Readable and writable / Not readable and not writable

The attributes may also require:

- Authentication to read or write
- Authorization to read or write
- Encryption and pairing to read or write

The attribute types and handles are public information, but the permissions are not. Therefore and read or write request may result an error *Read/Write Not Permitted* or *Insufficient authentication.*

Copyright © 2001-2012 Bluegiga Technologies

Attribute protocol methods:

The attribute protocol is a stateless sequential protocol, meaning that no state is stored in the protocol and only one operation can be performed at a time.

The available Attribute Protocol methods are described in the table below:

Method	Description	Direction
Find Information (starting handle, ending handle)	Used to discover attribute handles and their types (UUIDs)	Client -> Server
Find By Type Value (starting handle, ending handle, type, value)	Returns the handles of all attributes matching the type and value	Client -> Server
Read By Group Type (starting handle, ending handle, type)	Reads the value of each attribute of a given type in a range	Client -> Server
Read By Type (starting handle, ending handle, type)	Reads the value of each attribute of a given type in a range	Client -> Server
Read (handle)	Reads the value of given handle **Maximum payload : 22 bytes**	Client -> Server
Read Blob (handle, offset)	Can be used to read long attributes larger than 22 bytes. **Maximum payload: 64 kBytes**	Client -> Server
Read Multiple ([Handle]*)	Used to read multiple values at the same time	Client -> Server
Write (handle, value)	Writes the value to the given handle, with no response **Maximum payload: 20 bytes**	Client -> Server
Prepare Write (handle, offset, value) and Execute (exec/cancel)	Prepares a write procedure, which is queued in server until the write is executed.	Client -> Server
Handle Value Notification (handle, value)	Server notifies client of an attribute with a new value **Maximum payload: 20 bytes**	Server -> Client
Handle Value Indication (handle, value)	Server indicates to client an attribute with a new value. Client must confirm reception. **Maximum payload: 20 bytes**	Server -> Client
Error response	Any request can cause an error and error response contains information about the error	Server -> Client

Copyright © 2001-2012 Bluegiga Technologies

3.11 Generic Attribute Profile (GATT)

The Generic ATTribute profile (GATT) has similar client server structure as Attribute Protocol. However the GATT encapsulates data (attributes) into *services* and the data is exposed as *characteristics*.

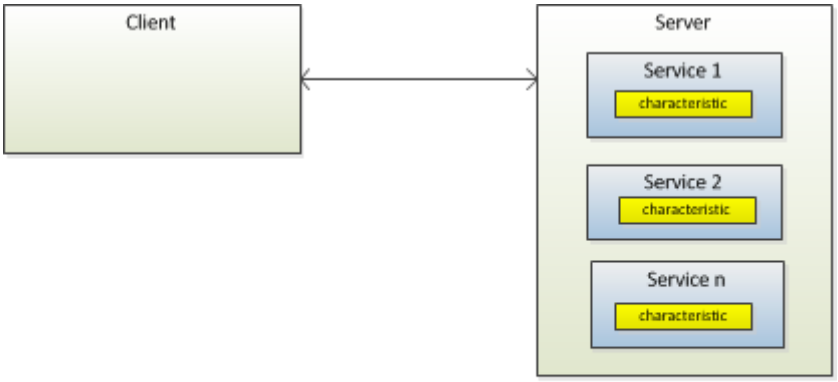

Figure 23: GATT architecture

GATT defines concepts of:

- Service Group
- Characteristic Group
- Declarations
- Descriptors

It's important also to understand that GATT does not does not define rules for their use.

Characteristics

Characteristic is a value, with a known type, and a known format. They characteristics are defined in “Characteristic Specification” available at http://developer.bluetooth.org.

Characteristics consist of:

- Characteristic Declaration
  Describes the properties of *characteristic value* (read, write, indicate etc.), *characteristic value* handle and *characteristic value* type (UUID)

- Characteristic Value
  Contains the value of the characteristic.

- Characteristic Descriptor(s)
  Provide additional information about the characteristic (characteristic user description, characteristic client configuration, vendor specific information etc.)

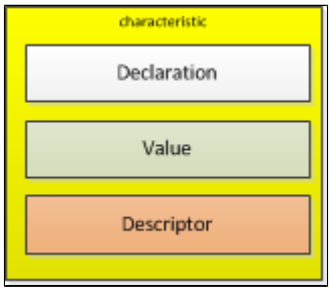

Figure 24: Characteristic format

Copyright © 2001-2012 Bluegiga Technologies

Service

A service is:

- defined in a service specification (http://developer.bluetooth.org)
- collection of characteristics
- references to other services

There are two types of service:

- Primary services
  A primary service exposes primary functionality of a device. It can be included by an other service.

- Secondary services
  Secondary service is a subservient of another primary or a secondary service. It's only relevant in the context of an other service.

Attributes alone are just flat:

Handle	Type	Value	Permissions
0x0001	«Primary Service»	«GAP»	R
0x0002	«Characteristic»	{r, 0x0003, «Device Name»}	R
0x0003	«Device Name»	"Temperature Sensor"	R
0x0004	«Characteristic»	{r, 0x0006, «Appearance»}	R
0x0006	«Appearance»	«Thermometer»	R
0x000F	«Primary Service»	«GATT»	R
0x0010	«Characteristic»	{r, 0x0012, «Attribute Opcodes Supported»}	R
0x0012	«Attribute Opcodes Supported»	0x00003FDF	R
0x0020	«Primary Service»	«Temperature»	R
0x0021	«Characteristic»	{r, 0x0022, «Temperature Celsius»}	R
0x0022	«Temperature Celsius»	0x0802	R*

Figure 25: List of attributes

Grouping attributes into services gives structure:

Handle	Type	Value	Permissions
0x0001	«Primary Service»	«GAP»	R
0x0002	«Characteristic»	{r, 0x0003, «Device Name»}	R
0x0003	«Device Name»	"Temperature Sensor"	R
0x0004	«Characteristic»	{r, 0x0006, «Appearance»}	R
0x0006	«Appearance»	«Thermometer»	R
0x000F	«Primary Service»	«GATT»	R
0x0010	«Characteristic»	{r, 0x0012, «Attribute Opcodes Supported»}	R
0x0012	«Attribute Opcodes Supported»	0x00003FDF	R
0x0020	«Primary Service»	«Temperature»	R
0x0021	«Characteristic»	{r, 0x0022, «Temperature Celsius»}	R
0x0022	«Temperature Celsius»	0x0802	R*

Figure 26: Attributes grouped into services

Copyright © 2001-2012 Bluegiga Technologies

GATT procedures

The available Attribute Protocol methods are described in the table below:

Procedure	Sub-Procedures
Server Configuration	Exchange MTU
Primary Service Discovery	Discovery All Primary Service Discover Primary Service by Service UUID.
Relationship Discovery	Find Included Services
Characteristic Discovery	Discover All Characteristics of a Service Discover Characteristics by UUID
Characteristic Descriptor Discovery	Discover All Characteristic Descriptors
Characteristic Value Read	Characteristic Value Read Read Characteristic Value Read Using Characteristic UUID Read Long Characteristic Values Read Multiple Characteristic Values
Characteristic Value Write	Write Without Response Write Without Response With Authentication Write Characteristic Value Write Long Characteristic Values Reliable Writes
Characteristic Value Notifications	Notifications
Characteristic Value Indications	Indications
Characteristic Descriptors	Read Characteristic Descriptors Read Long Characteristic Descriptors Write Characteristic Descriptors Write Long Characteristic Descriptors

Copyright © 2001-2012 Bluegiga Technologies

3.12 Generic Access Profile (GAP)

GAP defines device roles:

- **Broadcaster** : Sends advertising events, including characteristics, including service data (does not need RX)
- **Observer** : Receives advertising events, listens for characteristics, listens for service data (does not need TX)
- **Peripheral** : Has RX and TX, is always slave, is connectable and advertising
- **Central** : Has RX and TX, is always master, never advertises

GAP also defines modes and procedures for

- Discovery
- Connections
- Bonding

Privacy

- Non-Resolvable and Resolvable Private Addresses

Copyright © 2001-2012 Bluegiga Technologies

4 API definition

This section contains the generic *Bluetooth* low energy stack API definition. The definition consist of three parts:

- The BGAPI protocol definition
- The BGLib C library description
- The BGScript scriting API description

This section of the document only provides the generic definition and description of the API and the actual commands, responses and event are described in the API reference section.

4.1 BGAPI protocol definition

The general format of the binary host protocol is described in this section.

The maximum allowed packet size transferred to the stack is 64 bytes, which leads to the maximum payload of 60 bytes.

Packet format

Packets in either direction use the following format.

Table 1: BGAPI packet format

Octet	Octet bits	Length	Description	Notes
Octet 0	7	1 bit	**Message Type (MT)**	0: Command/Response 1: Event
...	6:3	4 bits	**Technology Type (TT)**	0000: Bluetooth 4.0 single mode 0001: Wi-Fi
...	2:0	3 bits	**Length High (LH)**	Payload length (high bits)
Octet 1	7:0	8 bits	**Length Low (LL)**	Payload length (low bits)
Octet 2	7:0	8 bits	**Class ID (CID)**	Command class ID
Octet 3	7:0	8 bits	**Command ID (CMD)**	Command ID
Octet 4-n	-	0 - 2048 Bytes	**Payload (PL)**	Up to 2048 bytes of payload

Message types

The following message types exist in the BGAPI protocol.

Table 2: BGAPI message types

Message type	Value	Description
Command	0x00	Command from host to the stack
Response	0x00	Response from stack to the host
Event	0x80	Event from stack to the host

Copyright © 2001-2012 Bluegiga Technologies

Command Class IDs

The following command classes exist.

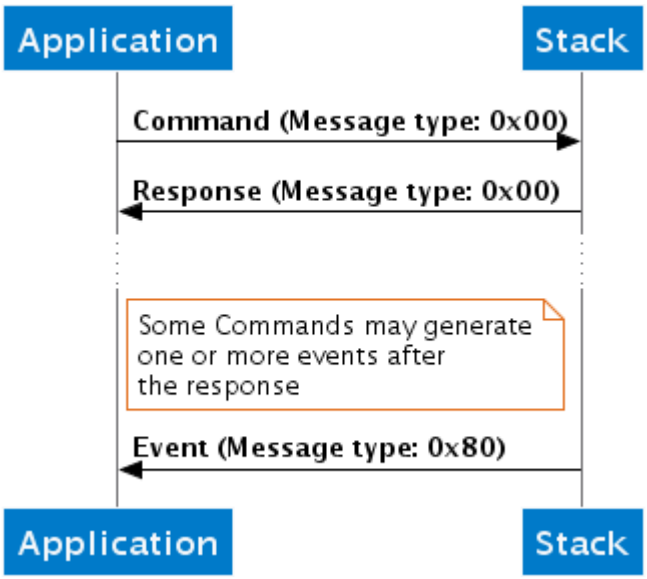
Table 3: BGAPI command classes

Class ID	Description	Explanation
0x00	System	Provides access to system functions
0x01	Persistent Store	Provides access the persistence store (parameters)
0x02	Attribute database	Provides access to local GATT database
0x03	Connection	Provides access to connection management functions
0x04	Attribute client	Functions to access remote devices GATT database
0x05	Security Manager	Bluetooth low energy security functions
0x06	Generic Access Profile	GAP functions
0x07	Hardware	Provides access to hardware such as timers and ADC

Packet Exchange

The BGAPI protocol is a simple command / response protocol.

- The host should wait for the response to a command before issuing another command.



Copyright © 2001-2012 Bluegiga Technologies

Packet format without the use of HW flow control

BGAPI protocol can also be used without UART hardware (RTS/CTS) flow control. Typically this is not possible, because UART buffer overflow can cause a loss of data and it could cause the loss of synchronization between the *Bluetooth* smart stack and the host, especially if the BGAPI header bytes are lost because of buffer overflow.

BGAPI however has an alternate mode where, which allows the use of BGAPI over a simple 2-wire (TX and RX) UART interface. This however requires that an additional **length byte** is added in front of all the BGAPI protocol commands, which tells the total length of the BGAPI command excluding the length byte itself.

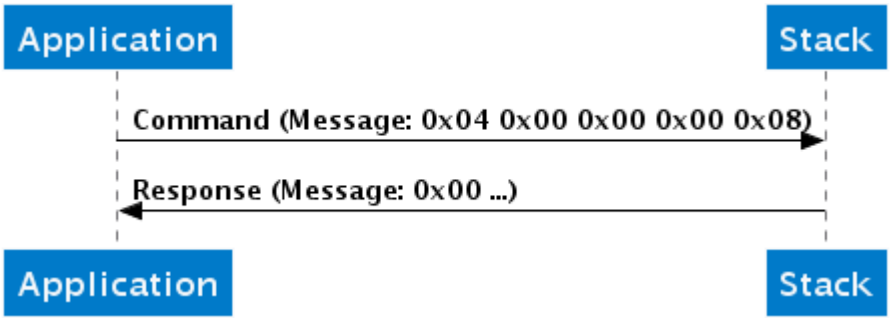
This operational mode needs to be especially enabled in the hardware configuration (**hardware.xml**) of your Bluetooth Smart project and is not used by default.

In this case the BGAPI protocol has the following format:

Table 4: BGAPI packet format

Octet	Octet bits	Length	Description	Notes
Octet 0	7:0	8 bits	**BGAPI command length**	Tells the length of the BGAPI command excluding the length byte itself
Octet 1	7	1 bit	**Message Type (MT)**	0: Command/Response 1: Event
...	6:3	4 bits	**Technology Type (TT)**	0000: Bluetooth 4.0 single mode 0001: Wi-Fi
...	2:0	3 bits	**Length High (LH)**	Payload length (high bits)
Octet 2	7:0	8 bits	**Length Low (LL)**	Payload length (low bits)
Octet 3	7:0	8 bits	**Class ID (CID)**	Command class ID
Octet 4	7:0	8 bits	**Command ID (CMD)**	Command ID
Octet 5-n	-	0 - 2048 Bytes	**Payload (PL)**	Up to 2048 bytes of payload

Below is a simple example which shows how a **System Get Info** (Raw: 0x00 0x00 0x00 0x08) is sent in this BGAPI packet format.



Copyright © 2001-2012 Bluegiga Technologies

4.2 BGLib functions definition

All the BGAPI commands are also available as ANSI C functions as a separate host library called BGLib. The responses and event on the other hand are handled as function call backs. The ANSI C functions are also documented in the API reference section.

The functions and callbacks are documented as follows:

C Functions

```
/* Function */
void ble_cmd_gap_connect_direct(
    bd_addr address ,
    uint8 addr_type ,
    uint16 conn_interval_min ,
    uint16 conn_interval_max ,
    uint16 timeout
);

/* Callback */
void ble_rsp_gap_connect_direct(
    uint16 result ,
    uint8 conn
);
```

The command parameters and return values are the same as used in the BGAPI binary protocol and they are not documented separately.

Callback programming

Callback programming is a style of computer programming, which allows lower layer of software to call functions defined on a higher layer. Callback is piece of code or a reference to a piece of code that is passed as an argument. The figure below illustrates the callback architecture used with BGLib.

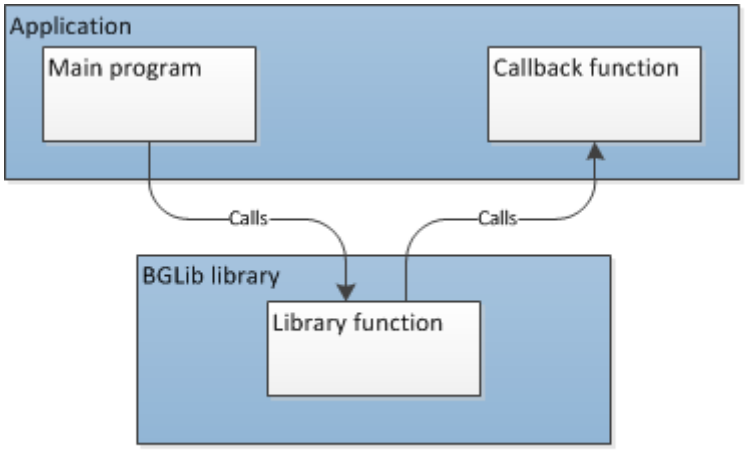


Figure 27: Callback arhitecture

If you are not familiar with callback programming a basic tutorial can for example be found from here:

http://www.codeguru.com/cpp/cpp/cpp_mfc/callbacks/article.php/c10557

Copyright © 2001-2012 Bluegiga Technologies

4.3 BGScript API definition

The BGScript functions are also documented in the API reference section. The format of the commands varies slightly from the C-library functions and instead of using call backs the BGScript functions take the return values as parameters.

BGScript commands are documented as follows:

BGScript Functions

```
CALL gap_connect_direct(address ,addr_type ,conn_interval_min
,conn_interval_max ,timeout )(result ,conn )
```

The BGScript command parameters and return values are the same as used in the BGAPI binary protocol and they are not documented separately.

Copyright © 2001-2012 Bluegiga Technologies

4.4 Data Types

The following data types used in documentation.

Table 5: Used data types

Type	Description	Example: Human readable	Example Packet data in hex
int8	signed integer stored in 1 byte twos complement form	-42	0xd6
uint8	unsigned integer stored in 1 byte	42	0x2a
uint16	unsigned integer stored in 2 bytes little endian format	1701	0xa5 0x06
uint32	unsigned integer stored in 4 bytes little endian format	1000000	0x40 0x42 0x0f 0x00
uint8array	byte array, first byte is array size	"Hello"	0x05 0x68 0x65 0x6c 0x6c 0x6f
bd_addr	Bluetooth address in little endian format	00:07:80:c0:ff:ee	0xee 0xff 0xc0 0x80 0x07 0x00

Copyright © 2001-2012 Bluegiga Technologies

5 API Reference

This section of the document contains the actual API description, so the description of commands, responses, events and enumerations. The high level categorizationis made based on the command classes, which are:

Description	Explanation
System	Provides access to system functions
Persistent Store	Provides access the persistence store (parameters)
Attribute database	Provides access to local GATT database
Connection	Provides access to connection management functions
Attribute client	Functions to access remote devices GATT database
Security Manager	Bluetooth low energy security functions
Generic Access Profile	GAP functions
Hardware	Provides access to hardware such as timers and ADC

Final section of the API reference contains description of the error codes categorized as follows:

Description
BGAPI errors
Bluetooth errors
Security manager errors
Attribute protocols errors

Copyright © 2001-2012 Bluegiga Technologies

5.1 Attribute Client

The Attribute Client class implements the Attribute Protocol (ATT) and provides access to the ATT protocol methods. The Attribute Client can be used to discover services and characteristics from ATT server, read and write values and manage indications and notifications.

5.1.1 Commands

Attribute Client commands

Attribute Write

Writes a remote attribute's value with given handle and value. Attribute write operation will be acknowledged by the remote end, telling the write was successful.

Attribute write can be used to write attribute values up to 20 bytes.

Table 6: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x04	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x05	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**atthandle**	Attribute handle to write to
7	**uint8array**	**data**	Attribute value

Table 7: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x05	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**result**	0 : write was successful Otherwise error occurred

Table 8: EVENTS

Event	Description
attclient procedure_completed	Write operation has been acknowledged by remote end

C Functions

```
/* Function */
void ble_cmd_attclient_attribute_write(
    uint8 connection,
    uint16 atthandle,
    uint8 data_len,
    const uint8* data_data
);

/* Callback */
struct ble_msg_attclient_attribute_write_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_attclient_attribute_write(
    const struct ble_msg_attclient_attribute_write_rsp_t * msg
)
```

BGScript Functions

```
call attclient_attribute_write(connection, atthandle, data_len,
data_data)(connection, result)
```

Execute Write

Executes or Cancels previously queued prepare_write commands on remote host

Table 9: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x0A	method	Message ID
4	**uint8**	**connection**	Connection Handle
5	**uint8**	**commit**	1 - commits queued writes, 0- cancels

Table 10: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x0A	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**result**	Command result

Table 11: EVENTS

Event	Description
attclient procedure_completed	Write operation has been acknowledged by remote end

C Functions

```
/* Function */
void ble_cmd_attclient_execute_write(
    uint8 connection,
    uint8 commit
);

/* Callback */
struct ble_msg_attclient_execute_write_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_attclient_execute_write(
    const struct ble_msg_attclient_execute_write_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call attclient_execute_write(connection, commit)(connection, result)
```

Find By Type Value

Used to find specific attributes. Returns the handles of all attributes matching the type (UUID) and value.

Table 12: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x08	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x00	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**start**	First requested handle number
7 - 8	**uint16**	**end**	Last requested handle number
9 - 10	**uint16**	**uuid**	2 octet UUID to find
11	**uint8array**	**value**	Attribute value to find

Table 13: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x00	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**result**	0 : the operation was successful Otherwise error occurred

Table 14: EVENTS

Event	Description
attclient group_found	Attributes found
attclient procedure_completed	Procedure has completed and new procedure can be started on GATT server

Find Information

This command is used to discover attribute handles and their types (UUIDs) in a given handle range.

Table 15: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x05	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x03	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**start**	First attribute handle
7 - 8	**uint16**	**end**	Last attribute handle

Table 16: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x03	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**result**	0 if the command was successful Otherwise error occurred

Table 17: EVENTS

Event	Description
attclient find_information_found	Handle, type - mapping found
attclient procedure_completed	Find information procedure has completed

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_attclient_find_information(
    uint8 connection,
    uint16 start,
    uint16 end
);

/* Callback */
struct ble_msg_attclient_find_information_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_attclient_find_information(
    const struct ble_msg_attclient_find_information_rsp_t * msg
)
```

BGScript Functions

```
call attclient_find_information(connection, start, end)(connection, result)
```

Copyright © 2001-2012 Bluegiga Technologies

Indicate Confirm

Send confirmation for received indication. Use only if manual indications are enabled in config.xml

Table 18: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x07	method	Message ID
4	**uint8**	**connection**	Connection Handle

Table 19: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x07	method	Message ID
4 - 5	**uint16**	**result**	Command result

C Functions

```
/* Function */
void ble_cmd_attclient_indicate_confirm(
    uint8 connection
);

/* Callback */
struct ble_msg_attclient_indicate_confirm_rsp_t{
    uint16 result
}
void ble_rsp_attclient_indicate_confirm(
    const struct ble_msg_attclient_indicate_confirm_rsp_t * msg
)
```

BGScript Functions

```
call attclient_indicate_confirm(connection)(result)
```

Prepare Write

Send prepare write request to remote host for queueing.

Queued writes are executed or canceled with attclient_execute_write command.

NOTE: It is not mandatory for server to support this command. It is recommended to use this command to only write long-attributes which do not fit in single att-packet.

Table 20: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x06	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x09	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**atthandle**	Attribute handle
7 - 8	**uint16**	**offset**	Offset to write to
9	**uint8array**	**data**	data to write

Table 21: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x09	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**result**	Command result

Table 22: EVENTS

Event	Description
attclient procedure_completed	Write operation has been acknowledged by remote end

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_attclient_prepare_write(
    uint8 connection,
    uint16 atthandle,
    uint16 offset,
    uint8 data_len,
    const uint8* data_data
);

/* Callback */
struct ble_msg_attclient_prepare_write_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_attclient_prepare_write(
    const struct ble_msg_attclient_prepare_write_rsp_t * msg
)
```

BGScript Functions

```
call attclient_prepare_write(connection, atthandle, offset, data_len,
data_data)(connection, result)
```

Read By Group Type

This command reads the value of each attribute of a given type and in a given handle range.

The command is typically used for primary (UUID: 0x2800) and secondary (UUID: 0x2801) service discovery.

Discovered services are reported by Group Found - event.

When procedure is completed Procedure Completed - event is generated.

Table 23: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x06	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x01	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**start**	First requested attribute handle
7 - 8	**uint16**	**end**	Last requested attribute handle
9	**uint8array**	**uuid**	group UUID to find

Table 24: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x01	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**result**	0 : the command was successful Otherwise error occurred

Table 25: EVENTS

Event	Description
attclient group_found	Attributes found
attclient procedure_completed	Procedure has completed and new procedure can be started on GATT server

Read By Handle

This command reads a remote attribute's value with the given handle. Read by handle can be used to read attributes up to 22 bytes.

Table 26: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x04	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**chrhandle**	Attribute handle

Table 27: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x04	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**result**	0 : the command was successful Otherwise error occurred

Table 28: EVENTS

Event	Description
attclient attribute_value	Attribute value received
attclient procedure_completed	ATT command failed

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_attclient_read_by_handle(
    uint8 connection,
    uint16 chrhandle
);

/* Callback */
struct ble_msg_attclient_read_by_handle_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_attclient_read_by_handle(
    const struct ble_msg_attclient_read_by_handle_rsp_t * msg
)
```

BGScript Functions

```
call attclient_read_by_handle(connection, chrhandle)(connection, result)
```

Copyright © 2001-2012 Bluegiga Technologies

Read By Type

Reads the value of each attribute of a given type (UUID) and in a given attribute handle range.

The command for example used to discover the characteristic declarations (UUID: 0x2803) of a service.

Table 29: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x06	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x02	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**start**	First attribute handle
7 - 8	**uint16**	**end**	Last attribute handle
9	**uint8array**	**uuid**	Attribute type (UUID)

Table 30: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x02	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**result**	0 : the command was successful Otherwise an error occurred

Table 31: EVENTS

Event	Description
attclient attribute_value	Attribute value read from GATT server
attclient procedure_completed	Returned if error occurred

C Functions

```
/* Function */
void ble_cmd_attclient_read_by_type(
    uint8 connection,
    uint16 start,
    uint16 end,
    uint8 uuid_len,
    const uint8* uuid_data
);

/* Callback */
struct ble_msg_attclient_read_by_type_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_attclient_read_by_type(
    const struct ble_msg_attclient_read_by_type_rsp_t * msg
)
```

BGScript Functions

```
call attclient_read_by_type(connection, start, end, uuid_len,
uuid_data)(connection, result)
```

Copyright © 2001-2012 Bluegiga Technologies

Read Long

Use this command to read long attribute values.

Starts a procedure where client first sends normal read to the server. and if returned attribute value length is equal to MTU, sends read long read requests until rest of the attribute is read.

Table 32: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x08	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**chrhandle**	Attribute handle

Table 33: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x08	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**result**	**0**: Command executed successfully **Non-zero** : An error occurred

Table 34: EVENTS

Event	Description
attclient attribute_value	Data received from remote end
attclient procedure_completed	Full attribute has read, or error occurred

Read Multiple

Read multiple attributes from server

Table 35: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x0B	method	Message ID
4	**uint8**	**connection**	Connection handle
5	**uint8array**	**handles**	List of attribute handles to read from remote end

Table 36: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x0B	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**result**	Command result

Table 37: EVENTS

Event	Description
attclient read_multiple_response	Attribute data if command was succesful
attclient procedure_completed	Operation has failed

C Functions

```
/* Function */
void ble_cmd_attclient_read_multiple(
    uint8 connection,
    uint8 handles_len,
    const uint8* handles_data
);

/* Callback */
struct ble_msg_attclient_read_multiple_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_attclient_read_multiple(
    const struct ble_msg_attclient_read_multiple_rsp_t * msg
)
```

Write Command

Writes a remote attribute's value with given handle and value. Write command will NOT be acknowledged by the remote end.

Write command can be used to write attribute values up to 20 bytes.

Table 38: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x04	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x06	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**atthandle**	Attribute handle to write
7	**uint8array**	**data**	Value for the attribute

Table 39: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x06	method	Message ID
4	**uint8**	**connection**	Connection Handle
5 - 6	**uint16**	**result**	**0**: Command executed successfully **Non-zero**: An error occurred

C Functions

```
/* Function */
void ble_cmd_attclient_write_command(
    uint8 connection,
    uint16 atthandle,
    uint8 data_len,
    const uint8* data_data
);

/* Callback */
struct ble_msg_attclient_write_command_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_attclient_write_command(
    const struct ble_msg_attclient_write_command_rsp_t * msg
)
```

5.1.2 Enumerations

Attribute Client commands

Attribute Value Types

Attribute Value Types

Table 40: VALUES

Value	Name	Description
0	attclient_attribute_value_type_read	Value was read
1	attclient_attribute_value_type_notify	Value was notified
2	attclient_attribute_value_type_indicate	Value was indicated
3	attclient_attribute_value_type_read_by_type	Value was read
4	attclient_attribute_value_type_read_blob	Value was part of long attribute
5	attclient_attribute_value_type_indicate_rsp_req	Value was indicated and remote end is waiting for confirmation, use Indicate Confirm to send confirmation to other end.

Copyright © 2001-2012 Bluegiga Technologies

5.1.3 Events

Attribute Client events

Attribute Value

This event is produced at the GATT client side when an attribute value is passed from the GATT server to the GATT client, typically after a Read by Handle command.

This is also received at the GATT client side when an attribute is indicated or notified by the GATT server to the GATT client.

Table 41: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x05	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x05	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**atthandle**	Attribute handle
7	**uint8**	**type**	Attribute type
8	**uint8array**	**value**	Attribute value (data)

C Functions

```
/* Callback */
struct ble_msg_attclient_attribute_value_evt_t{
    uint8 connection,
    uint16 atthandle,
    uint8 type,
    uint8 value_len,
    const uint8* value_data
}
void ble_evt_attclient_attribute_value(
    const struct ble_msg_attclient_attribute_value_evt_t * msg
)
```

BGScript Functions

```
event attclient_attribute_value(connection, atthandle, type, value_len,
value_data)
```

Copyright © 2001-2012 Bluegiga Technologies

Find Information Found

This event is generated when characteristics type mappings are found. Typically after Find Information command has been issued to discover all attributes of a service.

Table 42: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x04	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x04	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**chrhandle**	Characteristics handle
7	**uint8array**	**uuid**	Characteristics type (UUID)

C Functions

```
/* Callback */
struct ble_msg_attclient_find_information_found_evt_t{
    uint8 connection,
    uint16 chrhandle,
    uint8 uuid_len,
    const uint8* uuid_data
}
void ble_evt_attclient_find_information_found(
    const struct ble_msg_attclient_find_information_found_evt_t * msg
)
```

BGScript Functions

```
event attclient_find_information_found(connection, chrhandle, uuid_len,
uuid_data)
```

Copyright © 2001-2012 Bluegiga Technologies

Group Found

This event is produced when an attribute group (service) is found. Typically this event is produced after Read by Group Type command.

Table 43: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x06	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x02	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**start**	Starting handle
7 - 8	**uint16**	**end**	Ending handle (note "end" is a reserved word and in BG script, "end" cannot be used as such)
9	**uint8array**	**uuid**	UUID if the service Length is 0 if no services are found

C Functions

```
/* Callback */
struct ble_msg_attclient_group_found_evt_t{
    uint8 connection,
    uint16 start_handle,
    uint16 end_handle,
    uint8 uuid_len,
    const uint8* uuid_data
}
void ble_evt_attclient_group_found(
    const struct ble_msg_attclient_group_found_evt_t * msg
)
```

BGScript Functions

```
event attclient_group_found(connection, start_handle, end_handle, uuid_len,
uuid_data)
```

Copyright © 2001-2012 Bluegiga Technologies

Indicated

This event is produced at the GATT server side when an attribute is successfully indicated by the GATT server to the GATT client.

That is, the event is only produced at the GATT server if the indication is acknowledged by the GATT client at the remote side.

Table 44: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x03	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x00	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**attrhandle**	Attribute handle

C Functions

```
/* Callback */
struct ble_msg_attclient_indicated_evt_t{
    uint8 connection,
    uint16 attrhandle
}
void ble_evt_attclient_indicated(
    const struct ble_msg_attclient_indicated_evt_t * msg
)
```

BGScript Functions

```
event attclient_indicated(connection, attrhandle)
```

Copyright © 2001-2012 Bluegiga Technologies

Procedure Completed

This event is produced at the GATT client when an attribute protocol event is completed.

This event is produced for example after the attclient_attribute_write is used by the GATT client, to indicate if the GATT server has successfully updated the GATT database.

Table 45: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x05	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x01	method	Message ID
4	**uint8**	**connection**	Object Handle
5 - 6	**uint16**	**result**	0
7 - 8	**uint16**	**chrhandle**	Characteristic handle at which the event ended

C Functions

```
/* Callback */
struct ble_msg_attclient_procedure_completed_evt_t{
    uint8 connection,
    uint16 result,
    uint16 chrhandle
}
void ble_evt_attclient_procedure_completed(
    const struct ble_msg_attclient_procedure_completed_evt_t * msg
)
```

BGScript Functions

```
event attclient_procedure_completed(connection, result, chrhandle)
```

Copyright © 2001-2012 Bluegiga Technologies

Read Multiple Response

Response to read multiple request

Table 46: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x02	lolen	Minimum payload length
2	0x04	class	Message class: Attribute Client
3	0x06	method	Message ID
4	**uint8**	**connection**	Connection handle
5	**uint8array**	**handles**	List of attribute handles to read from remote end

C Functions

```
/* Callback */
struct ble_msg_attclient_read_multiple_response_evt_t{
    uint8 connection,
    uint8 handles_len,
    const uint8* handles_data
}
void ble_evt_attclient_read_multiple_response(
    const struct ble_msg_attclient_read_multiple_response_evt_t * msg
)
```

BGScript Functions

```
event attclient_read_multiple_response(connection, handles_len, handles_data)
```

5.2 Attribute Database

The Attribute Database class provides methods to read and write attributes to the devices local attribute database. This class is usually only needed on sensor devices (Attribute server) to update attribute values.

5.2.1 Commands

Attribute database commands

Read

The command reads the given attribute's value from the local database. There is a 32-byte limit in the amount of data that can be read at a time, so multiple instances of this command, using accordingly increasing offset, must be launched to completely read attributes which are more than 32 bytes in size..

Table 47: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x04	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x01	method	Message ID
4 - 5	**uint16**	**handle**	Handle of the attribute to read
6 - 7	**uint16**	**offset**	Offset to read from. 32 bytes can be read at max.

Table 48: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x07	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x01	method	Message ID
4 - 5	**uint16**	**handle**	Handle of the attribute which was read
6 - 7	**uint16**	**offset**	Offset read from
8 - 9	**uint16**	**result**	**0** : the read was successful **Non-zero**: An error occurred
10	**uint8array**	**value**	Value of the attribute

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_attributes_read(
    uint16 handle,
    uint16 offset
);

/* Callback */
struct ble_msg_attributes_read_rsp_t{
    uint16 handle,
    uint16 offset,
    uint16 result,
    uint8 value_len,
    const uint8* value_data
}
void ble_rsp_attributes_read(
    const struct ble_msg_attributes_read_rsp_t * msg
)
```

BGScript Functions

```
call attributes_read(handle, offset)(handle, offset, result, value_len,
value_data)
```

Copyright © 2001-2012 Bluegiga Technologies

Read Type

This command reads the given attribute's type (UUID) from the local database.

Table 49: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x02	method	Message ID
4 - 5	**uint16**	**handle**	Handle of the attribute to read

Table 50: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x05	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x02	method	Message ID
4 - 5	**uint16**	**handle**	Handle of the attribute which was read
6 - 7	**uint16**	**result**	**0:** if the read was successful **Non-zero**: An error occurred
8	**uint8array**	**value**	Value of the attribute type (UUID)

C Functions

```
/* Function */
void ble_cmd_attributes_read_type(
    uint16 handle
);

/* Callback */
struct ble_msg_attributes_read_type_rsp_t{
    uint16 handle,
    uint16 result,
    uint8 value_len,
    const uint8* value_data
}
void ble_rsp_attributes_read_type(
    const struct ble_msg_attributes_read_type_rsp_t * msg
)
```

BGScript Functions

```
call attributes_read_type(handle)(handle, result, value_len, value_data)
```

User Read Response

This command normally follows the event attributes_user_read_request. It includes the attribute data that have to be passed directly to the remote GATT client that just asked to read such attribute.

Respond to user attribute read request.

Table 51: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x03	method	Message ID
4	**uint8**	**connection**	Connection handle to respond to
5	**uint8**	**att_error**	Attribute errorcode to send if error, set to 0 to send datafield
6	**uint8array**	**value**	Data to send

Table 52: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x03	method	Message ID

C Functions

```
/* Function */
void ble_cmd_attributes_user_read_response(
    uint8 connection,
    uint8 att_error,
    uint8 value_len,
    const uint8* value_data
);

/* Callback *
void ble_rsp_attributes_user_read_response(
    const void *nul
)
```

BGScript Functions

```
call attributes_user_read_response(connection, att_error, value_len,
value_data)
```

Copyright © 2001-2012 Bluegiga Technologies

User Write Response

Response to attribute_changed event where reason is user-attribute write.

Table 53: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x04	method	Message ID
4	**uint8**	**connection**	Connection handle to respond to
5	**uint8**	**att_error**	Attribute errorcode to send if error, set to 0 to accept write

Table 54: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x04	method	Message ID

C Functions

```
/* Function */
void ble_cmd_attributes_user_write_response(
    uint8 connection,
    uint8 att_error
);

/* Callback *
void ble_rsp_attributes_user_write_response(
    const void *nul
)
```

BGScript Functions

```
call attributes_user_write_response(connection, att_error)
```

Copyright © 2001-2012 Bluegiga Technologies

Write

This command writes an attribute's value to the local database.

Table 55: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x04	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x00	method	Message ID
4 - 5	**uint16**	**handle**	Handle of the attribute to write
6	**uint8**	**offset**	Attribute offset to write data
7	**uint8array**	**value**	Value of the attribute to write

Table 56: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x02	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x00	method	Message ID
4 - 5	**uint16**	**result**	**0** : the write was successful **Non-zero**: An error occured

C Functions

```
/* Function */
void ble_cmd_attributes_write(
    uint16 handle,
    uint8 offset,
    uint8 value_len,
    const uint8* value_data
);

/* Callback */
struct ble_msg_attributes_write_rsp_t{
    uint16 result
}
void ble_rsp_attributes_write(
    const struct ble_msg_attributes_write_rsp_t * msg
)
```

BGScript Functions

```
call attributes_write(handle, offset, value_len, value_data)(result)
```

5.2.2 Enumerations

Attribute Database enumerations

Attribute Change Reason

Reason for attribute change

Table 57: VALUES

Value	Name	Description
0	attributes_attribute_change_reason_write_request	Value was written by remote end using write request
1	attributes_attribute_change_reason_write_command	Value was written by remote end using write command
2	attributes_attribute_change_reason_write_request_user	Value was written by remote end, stack is waiting for write response to be sent to other end. Use User Write Response to send response.

Copyright © 2001-2012 Bluegiga Technologies

Attribute Status Flags

Attribute status flags

Table 58: VALUES

Value	Name	Description
1	attributes_attribute_status_flag_notify	Notifications are enabled
2	attributes_attribute_status_flag_indicate	Indications are enabled

Copyright © 2001-2012 Bluegiga Technologies

5.2.3 Events

Attribute Database events

Status

This event indicates the attribute status flags have changed

Table 59: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x03	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x02	method	Message ID
4 - 5	**uint16**	**handle**	Attribute handle
6	**uint8**	**flags**	Attribute status flags See: Attribute Status Flags

C Functions

```
/* Callback */
struct ble_msg_attributes_status_evt_t{
    uint16 handle,
    uint8 flags
}
void ble_evt_attributes_status(
    const struct ble_msg_attributes_status_evt_t * msg
)
```

BGScript Functions

```
event attributes_status(handle, flags)
```

Copyright © 2001-2012 Bluegiga Technologies

User Read Request

User-backed attribute data is requested. In other words, this event is sent when remote GATT client is requesting to read an attribute set as "user" in the gatt.xml.

Respond to this event using attributes_user_read_response.

Table 60: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x06	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x01	method	Message ID
4	**uint8**	**connection**	Connection ID which requested attribute
5 - 6	**uint16**	**handle**	Attribute handle requested
7 - 8	**uint16**	**offset**	Attribute offset to send data from
9	**uint8**	**maxsize**	Maximum data size to respond with, if more data is sent extra bytes are ignored

C Functions

```
/* Callback */
struct ble_msg_attributes_user_read_request_evt_t{
    uint8 connection,
    uint16 handle,
    uint16 offset,
    uint8 maxsize
}
void ble_evt_attributes_user_read_request(
    const struct ble_msg_attributes_user_read_request_evt_t * msg
)
```

BGScript Functions

```
event attributes_user_read_request(connection, handle, offset, maxsize)
```

Copyright © 2001-2012 Bluegiga Technologies

Value

This event is produced at the GATT server side when a local attribute value is being written by a remote GATT client.

Table 61: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x07	lolen	Minimum payload length
2	0x02	class	Message class: Attribute Database
3	0x00	method	Message ID
4	**uint8**	**connection**	Connection handle
5	**uint8**	**reason**	Reason why value has changed see:[enum attributes_attribute_change_reason]
6 - 7	**uint16**	**handle**	Attribute handle, which was changed
8 - 9	**uint16**	**offset**	Offset into attribute value where data starts
10	**uint8array**	**value**	Attribute value

C Functions

```
/* Callback */
struct ble_msg_attributes_value_evt_t{
    uint8 connection,
    uint8 reason,
    uint16 handle,
    uint16 offset,
    uint8 value_len,
    const uint8* value_data
}
void ble_evt_attributes_value(
    const struct ble_msg_attributes_value_evt_t * msg
)
```

BGScript Functions

```
event attributes_value(connection, reason, handle, offset, value_len,
value_data)
```

5.3 Connection

The Connection class provides methods to manage *Bluetooth* low energy connections and their statuses.

5.3.1 Commands

Connection class commands

Disconnect

This command disconnects an active connection. The command sends a request to link layer to start disconnection procedure.

When link is disconnected Disconnected - event is produced.

Table 62: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x00	method	Message ID
4	**uint8**	**connection**	Connection handle

Table 63: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x00	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**result**	**0**: disconnection procedure succesfully started **Non-zero**: An error occurred

Table 64: EVENTS

Event	Description
connection disconnected	Sent after connection has disconnected

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_connection_disconnect(
    uint8 connection
);

/* Callback */
struct ble_msg_connection_disconnect_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_connection_disconnect(
    const struct ble_msg_connection_disconnect_rsp_t * msg
)
```

BGScript Functions

```
call connection_disconnect(connection)(connection, result)
```

Copyright © 2001-2012 Bluegiga Technologies

Get Rssi

This commands returns the Receiver Signal Strength Indication (RSSI) of an active connection.

At -38 dBm the BLE112 receiver is saturated. The measurement value may depend on the used hardware and design.

Table 65: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x01	method	Message ID
4	**uint8**	**connection**	Connection handle

Table 66: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x02	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x01	method	Message ID
4	**uint8**	**connection**	Connection handle
5	**int8**	**rssi**	RSSI value of the connection in dBm. **Range**: -103 to -38

C Functions

```
/* Function */
void ble_cmd_connection_get_rssi(
    uint8 connection
);

/* Callback */
struct ble_msg_connection_get_rssi_rsp_t{
    uint8 connection,
    int8 rssi
}
void ble_rsp_connection_get_rssi(
    const struct ble_msg_connection_get_rssi_rsp_t * msg
)
```

BGScript Functions

```
call connection_get_rssi(connection)(connection, rssi)
```

Copyright © 2001-2012 Bluegiga Technologies

Get Status

This command returns the status of the given connection.

Status is returned in Status event.

Table 67: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x07	method	Message ID
4	**uint8**	**connection**	Connection handle

Table 68: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x01	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x07	method	Message ID
4	**uint8**	**connection**	Connection handle

Table 69: EVENTS

Event	Description
connection status	Reports the status of a connection

C Functions

```
/* Function */
void ble_cmd_connection_get_status(
    uint8 connection
);

/* Callback */
struct ble_msg_connection_get_status_rsp_t{
    uint8 connection
}
void ble_rsp_connection_get_status(
    const struct ble_msg_connection_get_status_rsp_t * msg
)
```

BGScript Functions

```
call connection_get_status(connection)(connection)
```

Copyright © 2001-2012 Bluegiga Technologies

Update

This command updates the connection parameters of given connection.

If sent from a master, sends parameter update request to the link layer.

If sent from a slave, sends L2CAP connection parameter update request to the master.

Table 70: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x09	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x02	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**interval_min**	Minimum connection interval (units of 1.25ms)
7 - 8	**uint16**	**interval_max**	Maximum connection interval (units of 1.25ms)
9 - 10	**uint16**	**latency**	Slave latency (defines how many connections intervals a slave may skip)
11 - 12	**uint16**	**timeout**	Supervision timeout (units of 10ms)

Table 71: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x02	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**result**	**0** : the update was successful **Non-zero**: An error occurred.

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_connection_update(
    uint8 connection,
    uint16 interval_min,
    uint16 interval_max,
    uint16 latency,
    uint16 timeout
);

/* Callback */
struct ble_msg_connection_update_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_connection_update(
    const struct ble_msg_connection_update_rsp_t * msg
)
```

BGScript Functions

```
call connection_update(connection, interval_min, interval_max, latency,
timeout)(connection, result)
```

Copyright © 2001-2012 Bluegiga Technologies

Version Update

This command requests a version exchange of a given connection.

Table 72: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x03	method	Message ID
4	**uint8**	**connection**	Connection handle

Table 73: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x03	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**result**	**0** : the request was successful **Non-zero**: An error occurred

Table 74: EVENTS

Event	Description
connection version_ind	Sent after receiving version indication from other end

C Functions

```
/* Function */
void ble_cmd_connection_version_update(
    uint8 connection
);

/* Callback */
struct ble_msg_connection_version_update_rsp_t{
    uint8 connection,
    uint16 result
}
void ble_rsp_connection_version_update(
    const struct ble_msg_connection_version_update_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call connection_version_update(connection)(connection, result)
```

Copyright © 2001-2012 Bluegiga Technologies

5.3.2 Enumerations

Connection class enumerations

Connection Status Flags

The possible connection status flags are described in the table below. The flags field is a bit mask, so multiple flags can be set at a time. If the bit is 1 the flag is active and if the bit is 0 the flag is inactive.

Table 75: VALUES

Value	Name	Description
bit 0	connection_connected	This status flag tells the connection exists to a remote device.
bit 1	connection_encrypted	This flag tells the connection is encrypted.
bit 2	connection_completed	Connection completed flag, which is used to tell a new connection has been created.
bit 3	connection_parameters_change	This flag tells that connection parameters have changed and. It is set when connection parameters have changed due to a link layer operation.

Copyright © 2001-2012 Bluegiga Technologies

5.3.3 Events

Connection class events

Disconnected

This event is produces when a connection is disconnected.

Table 76: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x03	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x04	method	Message ID
4	**uint8**	**connection**	Connection handle
5 - 6	**uint16**	**reason**	Disconnection reason code **0** : disconnected by local user

C Functions

```
/* Callback */
struct ble_msg_connection_disconnected_evt_t{
    uint8 connection,
    uint16 reason
}
void ble_evt_connection_disconnected(
    const struct ble_msg_connection_disconnected_evt_t * msg
)
```

BGScript Functions

```
event connection_disconnected(connection, reason)
```

Copyright © 2001-2012 Bluegiga Technologies

Feature Ind

This event indicates the remote devices features.

Table 77: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x02	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x02	method	Message ID
4	**uint8**	**connection**	Connection handle
5	**uint8array**	**features**	CtrData field from LL_FEATURE_RSP - packet

C Functions

```
/* Callback */
struct ble_msg_connection_feature_ind_evt_t{
    uint8 connection,
    uint8 features_len,
    const uint8* features_data
}
void ble_evt_connection_feature_ind(
    const struct ble_msg_connection_feature_ind_evt_t * msg
)
```

BGScript Functions

```
event connection_feature_ind(connection, features_len, features_data)
```

Copyright © 2001-2012 Bluegiga Technologies

Status

This event indicates the connection status and parameters.

Table 78: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x10	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x00	method	Message ID
4	**uint8**	**connection**	Connection handle
5	**uint8**	**flags**	Connection status flags use connstatus-enumerator
6 - 11	**bd_addr**	**address**	Remote devices Bluetooth address
12	**uint8**	**address_type**	Remote address type see: Bluetooth Address Types--gap
13 - 14	**uint16**	**conn_interval**	Current connection interval (units of 1.25ms)
15 - 16	**uint16**	**timeout**	Current supervision timeout (units of 10ms)
17 - 18	**uint16**	**latency**	Slave latency (how many connection intervals the slave may skip)
19	**uint8**	**bonding**	bonding handle if there is stored bonding for this device 0xff otherwise

C Functions

```
/* Callback */
struct ble_msg_connection_status_evt_t{
    uint8 connection,
    uint8 flags,
    bd_addr address,
    uint8 address_type,
    uint16 conn_interval,
    uint16 timeout,
    uint16 latency,
    uint8 bonding
}
void ble_evt_connection_status(
    const struct ble_msg_connection_status_evt_t * msg
)
```

BGScript Functions

```
event connection_status(connection, flags, address, address_type,
conn_interval, timeout, latency, bonding)
```

Copyright © 2001-2012 Bluegiga Technologies

Version Ind

This event indicates the remote devices version.

Table 79: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x06	lolen	Minimum payload length
2	0x03	class	Message class: Connection
3	0x01	method	Message ID
4	**uint8**	**connection**	Connection handle
5	**uint8**	**vers_nr**	*Bluetooth* controller specification version
6 - 7	**uint16**	**comp_id**	Manufacturer of Bluetooth controller
8 - 9	**uint16**	**sub_vers_nr**	*Bluetooth* controller version

C Functions

```
/* Callback */
struct ble_msg_connection_version_ind_evt_t{
    uint8 connection,
    uint8 vers_nr,
    uint16 comp_id,
    uint16 sub_vers_nr
}
void ble_evt_connection_version_ind(
    const struct ble_msg_connection_version_ind_evt_t * msg
)
```

BGScript Functions

```
event connection_version_ind(connection, vers_nr, comp_id, sub_vers_nr)
```

Copyright © 2001-2012 Bluegiga Technologies

5.4 Generic Access Profile

The Generic Access Profile (GAP) class provides methods to control the GAP level functionality such as: device discovery, connection establishment and local devices connection and discovery modes. The GAP class also allows the control of local devices privacy mode.

5.4.1 Commands

Generic Access Profile class commands

Connect Direct

This command will start the GAP direct connection establishment procedure to a dedicated *Bluetooth* low energy device.

The device will enter scanning state and when connectable advertisement packet is received from a remote device, that matches given address, connection is opened to that device.

Procedure is cancelled with End Procedure - command

Table 80: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x0F	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x03	method	Message ID
4 - 9	**bd_addr**	**address**	Bluetooth address of the target device
10	**uint8**	**addr_type**	see: Bluetooth Address Types
11 - 12	**uint16**	**conn_interval_min**	Minimum connection interval (unit1.25ms)
13 - 14	**uint16**	**conn_interval_max**	Maximum connection interval (unit 1.25ms)
15 - 16	**uint16**	**timeout**	Supervision timeout (unit 10ms)
17 - 18	**uint16**	**latency**	This parameter configures the slave latency. Slave latency defines how many connection intervals slave can skip. Increasing slave latency will decrease the energy consumption of the slave in scenarios where slave does not have data to send at every connection interval. Range: **0 - 500** **0** : Slave latency is disabled. **Example:** Connection interval is 10ms and slave latency is 9. This means the slave has to communicate only every 100 ms, but can communicate every 10ms if needed. **Note:** ***Slave Latency*** x ***Connection interval*** can NOT be higher than supervision timeout.

Table 81: RESPONSE

Copyright © 2001-2012 Bluegiga Technologies

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x03	method	Message ID
4 - 5	**uint16**	**result**	**0** : procedure was succesfully started **Non-zero**: An error occurred
6	**uint8**	**connection_handle**	Connection handle that is reserved for new connection

Table 82: EVENTS

Event	Description
connection status	Sent after connection is established

C Functions

```
/* Function */
void ble_cmd_gap_connect_direct(
    bd_addr address,
    uint8 addr_type,
    uint16 conn_interval_min,
    uint16 conn_interval_max,
    uint16 timeout,
    uint16 latency
);

/* Callback */
struct ble_msg_gap_connect_direct_rsp_t{
    uint16 result,
    uint8 connection_handle
}
void ble_rsp_gap_connect_direct(
    const struct ble_msg_gap_connect_direct_rsp_t * msg
)
```

BGScript Functions

```
call gap_connect_direct(address, addr_type, conn_interval_min,
conn_interval_max, timeout, latency)(result, connection_handle)
```

Copyright © 2001-2012 Bluegiga Technologies

Connect Selective

This command will open a connection to any *Bluetooth* low energy device on the local devices white list.

Table 83: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x08	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x05	method	Message ID
4 - 5	**uint16**	**conn_interval_min**	Minimum connection interval
6 - 7	**uint16**	**conn_interval_max**	Maximum connection interval
8 - 9	**uint16**	**timeout**	Supervision timeout
10 - 11	**uint16**	**latency**	Slave latency

Table 84: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x05	method	Message ID
4 - 5	**uint16**	**result**	**0**: Command was executed successfully **Non-zero**: An error occurred
6	**uint8**	**connection_handle**	Connection handle reserved for connection

Discover

This command starts the GAP discovery procedure to scan for advertising devices.

Scanning parameters can be configured with the set_scan_parameters command.

To cancel succesfully started procedure use End Procedure - command

Table 86: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x02	method	Message ID
4	**uint8**	**mode**	see:GAP Discover Mode

Table 87: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x02	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x02	method	Message ID
4 - 5	**uint16**	**result**	**0**: Scan procedure was successfully started **Non-zero**: An error occurred

Table 88: EVENTS

Event	Description
gap scan_response	Discovered device scan response

C Functions

```
/* Function */
void ble_cmd_gap_discover(
    uint8 mode
);

/* Callback */
struct ble_msg_gap_discover_rsp_t{
    uint16 result
}
void ble_rsp_gap_discover(
    const struct ble_msg_gap_discover_rsp_t * msg
)
```

Set Adv Data

Set advertisement or scan response data. Use broadcast mode to advertise data

Table 91: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x09	method	Message ID
4	**uint8**	**set_scanrsp**	Advertisement data type **0 : sets advertisement data** **1 : sets scan response data**
5	**uint8array**	**adv_data**	Advertisement data to send

Table 92: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x09	method	Message ID
4 - 5	**uint16**	**result**	Command result

C Functions

```
/* Function */
void ble_cmd_gap_set_adv_data(
    uint8 set_scanrsp,
    uint8 adv_data_len,
    const uint8* adv_data_data
);

/* Callback */
struct ble_msg_gap_set_adv_data_rsp_t{
    uint16 result
}
void ble_rsp_gap_set_adv_data(
    const struct ble_msg_gap_set_adv_data_rsp_t * msg
)
```

BGScript Functions

```
call gap_set_adv_data(set_scanrsp, adv_data_len, adv_data_data)(result)
```

Set Adv Parameters

This command sets the advertising parameters

Device sends advertisement packet on each selected channel at each advertisement interval.

Interval_min and max defines recommended advertisement interval values for link-layer.

Table 93: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x05	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x08	method	Message ID
4 - 5	**uint16**	**adv_interval_min**	Minimum advertisement interval in units of 625us **Range:** 0x20 to 0x4000 (Default 0x200 = 320ms) **Explanation:** 0x200 = 512 512 * 625us = 320000us = 320ms
6 - 7	**uint16**	**adv_interval_max**	Maximum advertisement interval in units of 625us. **Range:** 0x20 to 0x4000 (Default 0x200 = 320ms)
8	**uint8**	**adv_channels**	A bit mask to identify which of the three advertisement channels are used. **Examples:** **0x07:** All three channels are used **0x03**: Advertisement channels 37 and 38 are used. **0x04:** Only advertisement channel 39 is used

Table 94: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x08	method	Message ID
4 - 5	**uint16**	**result**	**0**: Command was successfully executed **Non-zero**: An error occurred

Set Directed Connectable Mode

This command sets device to Directed Connectable mode.

In this mode the device uses fast advertisement procedure for 1.28 seconds, after which the device enters non-connectable mode. If device has a valid re-connection characteristic value, it will be used for connection. Otherwise the address and address type passed as parameters are used.

Re-connection characteristic is a conditional characteristic, which may be included in the GAP service.

Table 95: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x07	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x0A	method	Message ID
4 - 9	**bd_addr**	**address**	Address to connect to
10	**uint8**	**addr_type**	Address type to connect see:enum gap_address_type

Table 96: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x0A	method	Message ID
4 - 5	**uint16**	**result**	Command result

Table 97: EVENTS

Event	Description
connection status	Sent after connection is established

C Functions

```
/* Function */
void ble_cmd_gap_set_directed_connectable_mode(
    bd_addr address,
    uint8 addr_type
);

/* Callback */
struct ble_msg_gap_set_directed_connectable_mode_rsp_t{

Set Filtering

Set scan and advertising filtering parameters

Table 98: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x06	method	Message ID
4	**uint8**	**scan_policy**	see: enum gap_scan_policy
5	**uint8**	**adv_policy**	see: enum gap_advertising_policy
6	**uint8**	**scan_duplicate_filtering**	**0:** Do not filter duplicate advertisers **1:** Filter duplicates

Table 99: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x06	method	Message ID
4 - 5	**uint16**	**result**	**0**: The command was successfully executed **Non-zero**: An error occurred

C Functions

```
/* Function */
void ble_cmd_gap_set_filtering(
    uint8 scan_policy,
    uint8 adv_policy,
    uint8 scan_duplicate_filtering
);

/* Callback */
struct ble_msg_gap_set_filtering_rsp_t{
    uint16 result
}
void ble_rsp_gap_set_filtering(
    const struct ble_msg_gap_set_filtering_rsp_t * msg
)
```

BGScript Functions

```
call gap_set_filtering(scan_policy, adv_policy,
scan_duplicate_filtering)(result)
```

Set Privacy Flags

Set GAP central/peripheral privacy flags

NOTE: it is not recommended to manually adjust peripheral privacy because not all implementations can decode resolvable private addresses. It is here only for testing purposes

Table 103: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x00	method	Message ID
4	**uint8**	**peripheral_privacy**	1-enable peripheral privacy, 0- disable, all other values no effect on flag
5	**uint8**	**central_privacy**	1-enable central privacy, 0- disable, all other values no effect on flag

Table 104: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x00	method	Message ID

C Functions

```
/* Function */
void ble_cmd_gap_set_privacy_flags(
    uint8 peripheral_privacy,
    uint8 central_privacy
);

/* Callback *
void ble_rsp_gap_set_privacy_flags(
    const void *nul
)
```

BGScript Functions

```
call gap_set_privacy_flags(peripheral_privacy, central_privacy)
```

Set Scan Parameters

Set scan parameters

Table 105: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x05	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x07	method	Message ID
4 - 5	**uint16**	**scan_interval**	At what intervals is scanner started, unit is 625us
6 - 7	**uint16**	**scan_window**	How long to scan at each interval, unit is 625us must be equal or smaller than interval
8	**uint8**	**active**	1 - use active scanning, 0 - use passive scanning

Table 106: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x07	method	Message ID
4 - 5	**uint16**	**result**	**0**: The command was executed successfully **Non-zero**: An error occurred

C Functions

```
/* Function */
void ble_cmd_gap_set_scan_parameters(
    uint16 scan_interval,
    uint16 scan_window,
    uint8 active
);

/* Callback */
struct ble_msg_gap_set_scan_parameters_rsp_t{
    uint16 result
}
void ble_rsp_gap_set_scan_parameters(
    const struct ble_msg_gap_set_scan_parameters_rsp_t * msg
)
```

BGScript Functions

```
call gap_set_scan_parameters(scan_interval, scan_window, active)(result)
```

GAP Connectable Mode

GAP connectable mode

Table 111: VALUES

Value	Name	Description
0	gap_non_connectable	Not connectable
1	gap_directed_connectable	Direct Connectable
2	gap_undirected_connectable	Undirected connectable
3	gap_scannable_connectable	Same as undirected connectable, but uses ADV_SCAN_IND packets

Copyright © 2001-2012 Bluegiga Technologies

GAP Discoverable Mode

Gap discoverable mode

Table 112: VALUES

Value	Name	Description
0	gap_non_discoverable	Not discoverable
1	gap_limited_discoverable	Discoverable using limited scanning mode
2	gap_general_discoverable	Discoverable using general scanning mode
3	gap_broadcast	Discoverable in observation scanning mode. Limited or general discoverable bits not enabled in flags ad type.
4	gap_user_data	Send advertisement data defined by user.

Copyright © 2001-2012 Bluegiga Technologies

GAP Discover Mode

GAP Discoverable modes

Table 113: VALUES

Value	Name	Description
0	gap_discover_limited	Discover only limited discoverable devices
1	gap_discover_generic	Discover limited and generic discoverable devices
2	gap_discover_observation	Discover All devices

Copyright © 2001-2012 Bluegiga Technologies

SCAN_HEADER_FLAGS

Scan header flags

Table 114: VALUES

Value	Name	Description
0	GAP_SCAN_HEADER_ADV_IND	Connectable undirected advertising event
1	GAP_SCAN_HEADER_ADV_DIRECT_IND	Connectable directed advertising event
2	GAP_SCAN_HEADER_ADV_NONCONN_IND	Non-connectable undirected advertising event
3	GAP_SCAN_HEADER_SCAN_REQ	Scanner wants information from Advertiser
4	GAP_SCAN_HEADER_SCAN_RSP	Advertiser gives more information to Scanner
5	GAP_SCAN_HEADER_CONNECT_REQ	Initiator wants to connect to Advertiser
6	GAP_SCAN_HEADER_ADV_DISCOVER_IND	Non-connectable undirected advertising event

Copyright © 2001-2012 Bluegiga Technologies

Scan Policy

Scan Policy

Table 115: VALUES

Value	Name	Description
0	gap_scan_policy_all	Accept All advertisement Packets
1	gap_scan_policy_whitelist	Ignore advertisement packets not in whitelist

Copyright © 2001-2012 Bluegiga Technologies

5.4.3 Events

Generic Access Profile class events

Scan Response

This is a scan response event.

Table 116: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x0B	lolen	Minimum payload length
2	0x06	class	Message class: Generic Access Profile
3	0x00	method	Message ID
4	**int8**	**rssi**	RSSI value (dBm) **Range:** -103 to -38
5	**uint8**	**packet_type**	Scan response header **0**: Connectable Advertisement packet **2**: Non Connectable Advertisement packet **4**: Scan response packet **6**: Discoverable advertisement packet
6 - 11	**bd_addr**	**sender**	*Advertisers Bluetooth* address
12	**uint8**	**address_type**	Advertiser address type **1**: random address **0**: public address
13	**uint8**	**bond**	Bond handle if there is known bond for this device, 0xff otherwise
14	**uint8array**	**data**	Scan response data

C Functions

```
/* Callback */
struct ble_msg_gap_scan_response_evt_t{
    int8 rssi,
    uint8 packet_type,
    bd_addr sender,
    uint8 address_type,
    uint8 bond,
    uint8 data_len,
    const uint8* data_data
}
void ble_evt_gap_scan_response(
    const struct ble_msg_gap_scan_response_evt_t * msg
)
```

5.5 Hardware

The Hardware class provides methods to access the local devices hardware interfaces such as : A/D converters, IO and timers, I2C interface etc.

5.5.1 Commands

Hardware class commands

ADC Read

This command reads the devices local A/D converter.

Table 117: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x02	method	Message ID
4	**uint8**	**input**	Selects the ADC input. **0x0**: AIN0 **0x1**: AIN1 **0x2**: AIN2 **0x3**: AIN3 **0x4**: AIN4 **0x5**: AIN5 **0x6**: AIN6 **0x7**: AIN7 **0x8**: AIN0--AIN1 differential **0x9**: AIN2--AIN3 differential **0xa**: AIN4--AIN5 differential **0xb**: AIN6--AIN7 differential **0xc**: GND **0xd**: Reserved **0xe**: Temperature sensor **0xf**: VDD/3
5	**uint8**	**decimation**	Select resolution and conversion rate for conversion, result is always stored in MSB bits. **0**: 7 effective bits **1**: 9 effective bits **2**: 10 effective bits **3**: 12 effective bits
6	**uint8**	**reference_selection**	Selects the reference for the ADC. Reference corresponds to the maximum allowed input value. **0**: Internal reference (1.15V) **1**: External reference on AIN7 pin **2**: AVDD pin **3**: External reference on AIN6--AIN7 differential input

Table 118: RESPONSE

Copyright © 2001-2012 Bluegiga Technologies

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x02	method	Message ID
4 - 5	**uint16**	**result**	**0**: Command was executed successfully **Non-zero**: An error occurred

Table 119: EVENTS

Event	Description
hardare adc result	ADC read operation has completed

C Functions

```
/* Function */
void ble_cmd_hardware_adc_read(
    uint8 input,
    uint8 decimation,
    uint8 reference_selection
);

/* Callback */
struct ble_msg_hardware_adc_read_rsp_t{
    uint16 result
}
void ble_rsp_hardware_adc_read(
    const struct ble_msg_hardware_adc_read_rsp_t * msg
)
```

BGScript Functions

```
call hardware_adc_read(input, decimation, reference_selection)(result)
```

I2c Read

Read data from I2C bus using bit-bang method. On BLE112 module the I2C CLK is fixed to P1_7 and I2C data in P1_6. Pull-up must be enabled on both pins.

To convert a 7-bit I2C address to an 8-bit one, shift left by one bit. For example, a 7-bit address of 0x40 (dec 64) would be used as 0x80 (dec 128).

Table 120: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x0A	method	Message ID
4	**uint8**	**address**	I2C's 8-bit slave address with the read/write bit (LSB) set to zero.
5	**uint8**	**stop**	If nonzero Send I2C stop condition after transmission
6	**uint8**	**length**	Number of bytes to read

Table 121: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x0A	method	Message ID
4 - 5	**uint16**	**result**	Command result
6	**uint8array**	**data**	Data read

C Functions

```
/* Function */
void ble_cmd_hardware_i2c_read(
    uint8 address,
    uint8 stop,
    uint8 length
);

/* Callback */
struct ble_msg_hardware_i2c_read_rsp_t{
    uint16 result,
    uint8 data_len,
    const uint8* data_data
}
void ble_rsp_hardware_i2c_read(
    const struct ble_msg_hardware_i2c_read_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call hardware_i2c_read(address, stop, length)(result, data_len, data_data)
```

Copyright © 2001-2012 Bluegiga Technologies

I2c Write

Write data to I2C bus using bit-bang method. I2C CLK is fixed to P1_7 and I2C data in P1_6. Pull-up must be enabled on both pins.

To convert a 7-bit address to an 8-bit one, shift left by one bit. For example, a 7-bit address of 0x40 (dec 64) would be used as 0x80 (dec 128).

Table 122: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x0B	method	Message ID
4	**uint8**	**address**	I2C's 8-bit slave address with the read/write bit (LSB) set to zero.
5	**uint8**	**stop**	If nonzero Send I2C stop condition after transmission
6	**uint8array**	**data**	Data to write

Table 123: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x0B	method	Message ID
4	**uint8**	**written**	Bytes written

C Functions

```
/* Function */
void ble_cmd_hardware_i2c_write(
    uint8 address,
    uint8 stop,
    uint8 data_len,
    const uint8* data_data
);

/* Callback */
struct ble_msg_hardware_i2c_write_rsp_t{
    uint8 written
}
void ble_rsp_hardware_i2c_write(
    const struct ble_msg_hardware_i2c_write_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call hardware_i2c_write(address, stop, data_len, data_data)(written)
```

Io Port Config Direction

Configure I/O-port directions

Table 124: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x03	method	Message ID
4	**uint8**	**port**	I/0 PORT index: 0, 1 or 2
5	**uint8**	**direction**	Bitmask for each individual pin direction bit0 means input (default) bit1 means output Example: for all port's pins as output use $FF

Table 125: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x03	method	Message ID
4 - 5	**uint16**	**result**	**0**: Command was executed successfully **Non-zero**: An error occurred

C Functions

```
/* Function */
void ble_cmd_hardware_io_port_config_direction(
    uint8 port,
    uint8 direction
);

/* Callback */
struct ble_msg_hardware_io_port_config_direction_rsp_t{
    uint16 result
}
void ble_rsp_hardware_io_port_config_direction(
    const struct ble_msg_hardware_io_port_config_direction_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call hardware_io_port_config_direction(port, direction)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Io Port Config Function

This command configures the I/O-ports function.

If bit is set in function parameter then the corresponding I/O port is set to peripheral function, otherwise it is general purpose I/O pin.

Table 126: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x04	method	Message ID
4	**uint8**	**port**	I/O port 0,1,2
5	**uint8**	**function**	peripheral selection bit for pins

Table 127: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x04	method	Message ID
4 - 5	**uint16**	**result**	**0**: Command was executed successfully **Non-zero**: An error occurred

C Functions

```
/* Function */
void ble_cmd_hardware_io_port_config_function(
    uint8 port,
    uint8 function
);

/* Callback */
struct ble_msg_hardware_io_port_config_function_rsp_t{
    uint16 result
}
void ble_rsp_hardware_io_port_config_function(
    const struct ble_msg_hardware_io_port_config_function_rsp_t * msg
)
```

BGScript Functions

```
call hardware_io_port_config_function(port, function)(result)
```

IO Port Config IRQ

This command configures the locals I/O-port interrupts

Currently interrupts can not be enabled on I/O-port 2.

Table 128: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x00	method	Message ID
4	**uint8**	**port**	I/O port selection **Possible values. 0,1 or 2**
5	**uint8**	**enable_bits**	interrupt enable mask for pins
6	**uint8**	**falling_edge**	Interrupt sense for port. **0 : rising edge** **1 : falling edge** **Note**: affects all pins on port

Table 129: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x00	method	Message ID
4 - 5	**uint16**	**result**	error code, 0-success

Table 130: EVENTS

Event	Description
hardware io_port_status	Sent after pin change edge detected, and pin irq is enabled

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_hardware_io_port_config_irq(
    uint8 port,
    uint8 enable_bits,
    uint8 falling_edge
);

/* Callback */
struct ble_msg_hardware_io_port_config_irq_rsp_t{
    uint16 result
}
void ble_rsp_hardware_io_port_config_irq(
    const struct ble_msg_hardware_io_port_config_irq_rsp_t * msg
)
```

BGScript Functions

```
call hardware_io_port_config_irq(port, enable_bits, falling_edge)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Io Port Config Pull

Configure I/O-port pull-up/pull-down

> ⚠ Pins P1_0 and P1_1 do not have pullup/pulldown.

Table 131: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x05	method	Message ID
4	**uint8**	**port**	I/O port select: 0, 1 or 2
5	**uint8**	**tristate_mask**	If bit is set, disabled pull on pin
6	**uint8**	**pull_up**	1: pull all port's pins up 0: pull all port's pins down

Table 132: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x05	method	Message ID
4 - 5	**uint16**	**result**	error code, 0-success

C Functions

```
/* Function */
void ble_cmd_hardware_io_port_config_pull(
    uint8 port,
    uint8 tristate_mask,
    uint8 pull_up
);

/* Callback */
struct ble_msg_hardware_io_port_config_pull_rsp_t{
    uint16 result
}
void ble_rsp_hardware_io_port_config_pull(
    const struct ble_msg_hardware_io_port_config_pull_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call hardware_io_port_config_pull(port, tristate_mask, pull_up)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Io Port Read

Read I/O-port

Table 133: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x07	method	Message ID
4	**uint8**	**port**	I/O port to read 0,1,2
5	**uint8**	**mask**	I/O pins to read

Table 134: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x04	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x07	method	Message ID
4 - 5	**uint16**	**result**	error code, 0-success
6	**uint8**	**port**	I/O port read
7	**uint8**	**data**	I/O port pin state

C Functions

```
/* Function */
void ble_cmd_hardware_io_port_read(
    uint8 port,
    uint8 mask
);

/* Callback */
struct ble_msg_hardware_io_port_read_rsp_t{
    uint16 result,
    uint8 port,
    uint8 data
}
void ble_rsp_hardware_io_port_read(
    const struct ble_msg_hardware_io_port_read_rsp_t * msg
)
```

BGScript Functions

```
call hardware_io_port_read(port, mask)(result, port, data)
```

Copyright © 2001-2012 Bluegiga Technologies

Io Port Write

Write I/O-port

Table 135: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x06	method	Message ID
4	**uint8**	**port**	I/O port to write to 0,1,2
5	**uint8**	**mask**	Pins to modify
6	**uint8**	**data**	Pin values to set

Table 136: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x06	method	Message ID
4 - 5	**uint16**	**result**	error code, 0-success

C Functions

```
/* Function */
void ble_cmd_hardware_io_port_write(
    uint8 port,
    uint8 mask,
    uint8 data
);

/* Callback */
struct ble_msg_hardware_io_port_write_rsp_t{
    uint16 result
}
void ble_rsp_hardware_io_port_write(
    const struct ble_msg_hardware_io_port_write_rsp_t * msg
)
```

BGScript Functions

```
call hardware_io_port_write(port, mask, data)(result)
```

Set Soft Timer

This command configures the local software timer. The timer is 22 bits so the maximum value with BLE112 is 2^22 = 4194304/32768Hz = 256 seconds. With BLED112 USB dongle the maximum value is 2^22 = 4194304/32000Hz = 261 seconds

Table 137: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x06	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x01	method	Message ID
4 - 7	**uint32**	**time**	Timer interrupt period in units of local crystal frequency. **time** = 1/32768 seconds if sleep oscillator is installed **time** = 1/32000 seconds if internal RC oscillator is used If time is 0, removes scheduled timer
8	**uint8**	**handle**	Handle that is sent back in event
9	**uint8**	**single_shot**	Timer mode **0: if timer is repeating** **1: sent timer event only once**

Table 138: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x01	method	Message ID
4 - 5	**uint16**	**result**	Command result

Table 139: EVENTS

Event	Description
hardware soft_timer	Sent after specified interval

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_hardware_set_soft_timer(
    uint32 time,
    uint8 handle,
    uint8 single_shot
);

/* Callback */
struct ble_msg_hardware_set_soft_timer_rsp_t{
    uint16 result
}
void ble_rsp_hardware_set_soft_timer(
    const struct ble_msg_hardware_set_soft_timer_rsp_t * msg
)
```

BGScript Functions

```
call hardware_set_soft_timer(time, handle, single_shot)(result)
```

Set Txpower

Set TX Power

Table 140: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x0C	method	Message ID
4	**uint8**	**power**	TX power level to use **Range: 0 to 15** **which give the real TX power from -23 to +3 dBm**

Table 141: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x0C	method	Message ID

C Functions

```
/* Function */
void ble_cmd_hardware_set_txpower(
    uint8 power
);

/* Callback *
void ble_rsp_hardware_set_txpower(
    const void *nul
)
```

BGScript Functions

```
call hardware_set_txpower(power)
```

Spi Config

Configure SPI

Table 142: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x06	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x08	method	Message ID
4	**uint8**	**channel**	USART channel 0,1
5	**uint8**	**polarity**	Clock polarity 0,1
6	**uint8**	**phase**	Clock phase 0,1
7	**uint8**	**bit_order**	Endianness select, 0-LSB 1-MSB first
8	**uint8**	**baud_e**	baud rate exponent value
9	**uint8**	**baud_m**	baud rate mantissa value

Table 143: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x08	method	Message ID
4 - 5	**uint16**	**result**	error code, 0-success

C Functions

```
/* Function */
void ble_cmd_hardware_spi_config(
    uint8 channel,
    uint8 polarity,
    uint8 phase,
    uint8 bit_order,
    uint8 baud_e,
    uint8 baud_m
);

/* Callback */
struct ble_msg_hardware_spi_config_rsp_t{
    uint16 result
}
void ble_rsp_hardware_spi_config(
    const struct ble_msg_hardware_spi_config_rsp_t * msg
)
```

BGScript Functions

```
call hardware_spi_config(channel, polarity, phase, bit_order, baud_e,
baud_m)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Spi Transfer

Transfer SPI data, up to 64 bytes.

Table 144: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x09	method	Message ID
4	**uint8**	**channel**	SPI channel (0 or 1)
5	**uint8array**	**data**	Data to transmit (64 bytes at max)

Table 145: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x04	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x09	method	Message ID
4 - 5	**uint16**	**result**	error code, 0-success
6	**uint8**	**channel**	SPI channel used
7	**uint8array**	**data**	data received

C Functions

```
/* Function */
void ble_cmd_hardware_spi_transfer(
    uint8 channel,
    uint8 data_len,
    const uint8* data_data
);

/* Callback */
struct ble_msg_hardware_spi_transfer_rsp_t{
    uint16 result,
    uint8 channel,
    uint8 data_len,
    const uint8* data_data
}

Timer Comparator

Set comparator for timer channel.

This command may be used to generate e.g. PWM signals with hardware timer. More information on different comparator modes and their usage may be found from Texas Instruments CC2540 User's Guide (SWRU191B), section 9.8 Output Compare Mode.

Table 146: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x05	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x0D	method	Message ID
4	**uint8**	**timer**	Timer
5	**uint8**	**channel**	Timer channel
6	**uint8**	**mode**	Comparator mode
7 - 8	**uint16**	**comparator_value**	Comparator value

Table 147: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x0D	method	Message ID
4 - 5	**uint16**	**result**	Command result

C Functions

```
/* Function */
void ble_cmd_hardware_timer_comparator(
    uint8 timer,
    uint8 channel,
    uint8 mode,
    uint16 comparator_value
);

/* Callback */
struct ble_msg_hardware_timer_comparator_rsp_t{
    uint16 result
}
void ble_rsp_hardware_timer_comparator(
    const struct ble_msg_hardware_timer_comparator_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call hardware_timer_comparator(timer, channel, mode, comparator_value)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

5.5.2 Events

Hardware class events

ADC Result

This events is produced when an A/D converter result is received.

Table 148: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x03	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x02	method	Message ID
4	**uint8**	**input**	A/D input from which value is received from
5 - 6	**int16**	**value**	A/D value

C Functions

```
/* Callback */
struct ble_msg_hardware_adc_result_evt_t{
    uint8 input,
    int16 value
}
void ble_evt_hardware_adc_result(
    const struct ble_msg_hardware_adc_result_evt_t * msg
)
```

BGScript Functions

```
event hardware_adc_result(input, value)
```

Copyright © 2001-2012 Bluegiga Technologies

IO Port Status

This event is produced when I/O port status changes.

Table 149: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x07	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x00	method	Message ID
4 - 7	**uint32**	**timestamp**	Value of internal timer **Range** : 0 to 2^24-1
8	**uint8**	**port**	I/O port
9	**uint8**	**irq**	I/O flags Tells which port caused interrupt (bitmask).
10	**uint8**	**state**	Current status of all I/Os in **port** (bitmask).

C Functions

```
/* Callback */
struct ble_msg_hardware_io_port_status_evt_t{
    uint32 timestamp,
    uint8 port,
    uint8 irq,
    uint8 state
}
void ble_evt_hardware_io_port_status(
    const struct ble_msg_hardware_io_port_status_evt_t * msg
)
```

BGScript Functions

```
event hardware_io_port_status(timestamp, port, irq, state)
```

Copyright © 2001-2012 Bluegiga Technologies

Soft Timer

This event is produced when software timer interrupt is generated.

Table 150: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x01	lolen	Minimum payload length
2	0x07	class	Message class: Hardware
3	0x01	method	Message ID
4	**uint8**	**handle**	The software timer handle

C Functions

```
/* Callback */
struct ble_msg_hardware_soft_timer_evt_t{
    uint8 handle
}
void ble_evt_hardware_soft_timer(
    const struct ble_msg_hardware_soft_timer_evt_t * msg
)
```

BGScript Functions

```
event hardware_soft_timer(handle)
```

5.6 Persistent Store

The Persistent Store (PS) class provides methods to read write and dump the local devices parameters (PS keys).

5.6.1 Commands

Persistent Store class commands

PS Defrag

This command defragments the Persistent Store.

Table 151: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x00	method	Message ID

Table 152: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x00	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x00	method	Message ID

C Functions

```
/* Function */
void ble_cmd_flash_ps_defrag(
    void
);

/* Callback *
void ble_rsp_flash_ps_defrag(
    const void *nul
)
```

BGScript Functions

```
call flash_ps_defrag()
```

Copyright © 2001-2012 Bluegiga Technologies

PS Dump

This command dumps all Persistent Store keys.

Table 153: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x01	method	Message ID

Table 154: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x00	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x01	method	Message ID

Table 155: EVENTS

Event	Description
flash ps_key	PS Key contents

C Functions

```
/* Function */
void ble_cmd_flash_ps_dump(
    void
);

/* Callback *
void ble_rsp_flash_ps_dump(
    const void *nul
)
```

BGScript Functions

```
call flash_ps_dump()
```

Copyright © 2001-2012 Bluegiga Technologies

PS Erase All

This command erases all Persistent Store keys.

NOTE: Reboot is required after using this command, device will generate missing encryption keys and update bonding cache on boot.

Table 156: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x02	method	Message ID

Table 157: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x00	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x02	method	Message ID

C Functions

```
/* Function */
void ble_cmd_flash_ps_erase_all(
    void
);

/* Callback *
void ble_rsp_flash_ps_erase_all(
    const void *nul
)
```

BGScript Functions

```
call flash_ps_erase_all()
```

Copyright © 2001-2012 Bluegiga Technologies

PS Erase

This command erases a Persistent Store key given as parameter.

Table 158: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x05	method	Message ID
4 - 5	**uint16**	**key**	Key to erase

Table 159: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x00	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x05	method	Message ID

C Functions

```
/* Function */
void ble_cmd_flash_ps_erase(
    uint16 key
);

/* Callback *
void ble_rsp_flash_ps_erase(
    const void *nul
)
```

BGScript Functions

```
call flash_ps_erase(key)
```

Copyright © 2001-2012 Bluegiga Technologies

PS Load

This command reads a Persistent Store key from the local device.

Table 160: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x04	method	Message ID
4 - 5	**uint16**	**key**	Key to load Keys 8000 to 807F can be read.

Table 161: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x04	method	Message ID
4 - 5	**uint16**	**result**	0 : the read was successful
6	**uint8array**	**value**	Key's value

C Functions

```
/* Function */
void ble_cmd_flash_ps_load(
    uint16 key
);

/* Callback */
struct ble_msg_flash_ps_load_rsp_t{
    uint16 result,
    uint8 value_len,
    const uint8* value_data
}
void ble_rsp_flash_ps_load(
    const struct ble_msg_flash_ps_load_rsp_t * msg
)
```

BGScript Functions

```
call flash_ps_load(key)(result, value_len, value_data)
```

Copyright © 2001-2012 Bluegiga Technologies

PS Save

This command saves a Persistent Store (PS) key to the local device. The size of a single PS-key is 32 bytes and a total of 128 keys are available.

Table 162: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x03	method	Message ID
4 - 5	**uint16**	**key**	Key to save. Keys 8000 to 807F can be used for persistent storage of user data.
6	**uint8array**	**value**	Value of the key

Table 163: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x02	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x03	method	Message ID
4 - 5	**uint16**	**result**	0 : the write was successful

C Functions

```
/* Function */
void ble_cmd_flash_ps_save(
    uint16 key,
    uint8 value_len,
    const uint8* value_data
);

/* Callback */
struct ble_msg_flash_ps_save_rsp_t{
    uint16 result
}
void ble_rsp_flash_ps_save(
    const struct ble_msg_flash_ps_save_rsp_t * msg
)
```

BGScript Functions

```
call flash_ps_save(key, value_len, value_data)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

5.6.2 Events

Persistent Store class events

PS Key

This event is produced during a Persistent Store key dump for every dumped key.

Table 164: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x03	lolen	Minimum payload length
2	0x01	class	Message class: Persistent Store
3	0x00	method	Message ID
4 - 5	**uint16**	**key**	Persistent Store key ID
6	**uint8array**	**value**	Key value

C Functions

```
/* Callback */
struct ble_msg_flash_ps_key_evt_t{
    uint16 key,
    uint8 value_len,
    const uint8* value_data
}
void ble_evt_flash_ps_key(
    const struct ble_msg_flash_ps_key_evt_t * msg
)
```

BGScript Functions

```
event flash_ps_key(key, value_len, value_data)
```

Copyright © 2001-2012 Bluegiga Technologies

5.7 Security Manager

The Security Manager (SM) class provides access to the Bluetooth low energy Security Manager methods such as : bonding management and modes and encryption control.

5.7.1 Commands

Security Manager class commands

Delete Bonding

This command deletes a bonding from the local security database. There can be a maximum of 8 bonded devices stored at the same time, and one of them must be deleted if you need bonding with a 9th device.

Table 165: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x02	method	Message ID
4	**uint8**	**handle**	Bonding handle of a device. This handle can be obtained for example from events like: Scan Response Status

Table 166: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x02	method	Message ID
4 - 5	**uint16**	**result**	Command result

C Functions

```
/* Function */
void ble_cmd_sm_delete_bonding(
    uint8 handle
);

/* Callback */
struct ble_msg_sm_delete_bonding_rsp_t{
    uint16 result
}
void ble_rsp_sm_delete_bonding(
    const struct ble_msg_sm_delete_bonding_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call sm_delete_bonding(handle)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Encrypt Start

This command starts the encryption for a given connection.

|

Table 167: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x00	method	Message ID
4	**uint8**	**handle**	Connection handle
5	**uint8**	**bonding**	Create bonding if devices are not already bonded

Table 168: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x03	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x00	method	Message ID
4	**uint8**	**handle**	Connection handle
5 - 6	**uint16**	**result**	0 : the encryption was started successfully

Table 169: EVENTS

Event	Description
sm_bonding_fail	Sent if encryption or bonding fails
connection_status	Sent when connectino is encrypted

Copyright © 2001-2012 Bluegiga Technologies

C Functions

```
/* Function */
void ble_cmd_sm_encrypt_start(
    uint8 handle,
    uint8 bonding
);

/* Callback */
struct ble_msg_sm_encrypt_start_rsp_t{
    uint8 handle,
    uint16 result
}
void ble_rsp_sm_encrypt_start(
    const struct ble_msg_sm_encrypt_start_rsp_t * msg
)
```

BGScript Functions

```
call sm_encrypt_start(handle, bonding)(handle, result)
```

Copyright © 2001-2012 Bluegiga Technologies

Get Bonds

List all bonded devices. There can be a maximum of 8 bonded devices. The information related to the bonded devices is stored in the Flash memory, so it is persistent across resets and power-cycles.

Table 170: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x05	method	Message ID

Table 171: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x05	method	Message ID
4	**uint8**	**bonds**	Num of currently bonded devices

Table 172: EVENTS

Event	Description
sm bond_status	Bond status for each bonded device

C Functions

```
/* Function */
void ble_cmd_sm_get_bonds(
    void
);

/* Callback */
struct ble_msg_sm_get_bonds_rsp_t{
    uint8 bonds
}
void ble_rsp_sm_get_bonds(
    const struct ble_msg_sm_get_bonds_rsp_t * msg
)
```

BGScript Functions

```
call sm_get_bonds()(bonds)
```

Copyright © 2001-2012 Bluegiga Technologies

Passkey Entry

A command used to enter a passkey required for Man-in-the-Middle pairing.

Table 173: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x05	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x04	method	Message ID
4	**uint8**	**handle**	Connection Handle
5 - 8	**uint32**	**passkey**	Passkey **Range**: 000000-999999

Table 174: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x04	method	Message ID
4 - 5	**uint16**	**result**	

C Functions

```
/* Function */
void ble_cmd_sm_passkey_entry(
    uint8 handle,
    uint32 passkey
);

/* Callback */
struct ble_msg_sm_passkey_entry_rsp_t{
    uint16 result
}
void ble_rsp_sm_passkey_entry(
    const struct ble_msg_sm_passkey_entry_rsp_t * msg
)
```

BGScript Functions

```
call sm_passkey_entry(handle, passkey)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Set Bondable Mode

Set device to bondable mode

Table 175: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x01	method	Message ID
4	**uint8**	**bondable**	Enables or disables bonding mode **0** : the device is not bondable **1** : the device is bondable

Table 176: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x01	method	Message ID

C Functions

```
/* Function */
void ble_cmd_sm_set_bondable_mode(
    uint8 bondable
);

/* Callback *
void ble_rsp_sm_set_bondable_mode(
    const void *nul
)
```

BGScript Functions

```
call sm_set_bondable_mode(bondable)
```

Copyright © 2001-2012 Bluegiga Technologies

Set Oob Data

Set out-of-band encryption data for device
Device does not allow any other kind of pairing except oob if oob data is set.

Table 177: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x06	method	Message ID
4	**uint8array**	**oob**	OOB data to set, if empty clear oob data

Table 178: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x06	method	Message ID

C Functions

```
/* Function */
void ble_cmd_sm_set_oob_data(
    uint8 oob_len,
    const uint8* oob_data
);

/* Callback *
void ble_rsp_sm_set_oob_data(
    const void *nul
)
```

BGScript Functions

```
call sm_set_oob_data(oob_len, oob_data)
```

Copyright © 2001-2012 Bluegiga Technologies

Set Parameters

Configure Security Manager

Table 179: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x03	method	Message ID
4	**uint8**	**mitm**	Man-in-the-middle protection required
5	**uint8**	**min_key_size**	minimum key size in bytes range 7-16
6	**uint8**	**io_capabilities**	see:SMP IO Capabilities

Table 180: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x03	method	Message ID

C Functions

```
/* Function */
void ble_cmd_sm_set_parameters(
    uint8 mitm,
    uint8 min_key_size,
    uint8 io_capabilities
);

/* Callback *
void ble_rsp_sm_set_parameters(
    const void *nul
)
```

BGScript Functions

```
call sm_set_parameters(mitm, min_key_size, io_capabilities)
```

Copyright © 2001-2012 Bluegiga Technologies

5.7.2 Enumerations

Security Manager commands

Bonding Keys

Bonding information stored

Table 181: VALUES

Value	Name	Description
0x01	sm_bonding_key_ltk	LTK saved in master
0x02	sm_bonding_key_addr_public	Public Address
0x04	sm_bonding_key_addr_static	Static Address
0x08	sm_bonding_key_irk	Identity resolving key for resolvable private addresses
0x10	sm_bonding_key_edivrand	EDIV+RAND received from slave
0x20	sm_bonding_key_csrk	Connection signature resolving key
0x40	sm_bonding_key_masterid	EDIV+RAND sent to master

Copyright © 2001-2012 Bluegiga Technologies

SMP IO Capabilities

SMP IO Capabilities

Table 182: VALUES

Value	Name	Description
0	sm_io_capability_displayonly	Display Only
1	sm_io_capability_displayyesno	Display with Yes/No-buttons
2	sm_io_capability_keyboardonly	Keyboard Only
3	sm_io_capability_noinputnooutput	No Input and No Output
4	sm_io_capability_keyboarddisplay	Display with Keyboard

Copyright © 2001-2012 Bluegiga Technologies

5.7.3 Events

Security Manager class events

Bonding Fail

Link bonding has failed

Table 183: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x03	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x01	method	Message ID
4	**uint8**	**handle**	Connection handle
5 - 6	**uint16**	**result**	Encryption status, describes error that occurred during bonding

C Functions

```
/* Callback */
struct ble_msg_sm_bonding_fail_evt_t{
    uint8 handle,
    uint16 result
}
void ble_evt_sm_bonding_fail(
    const struct ble_msg_sm_bonding_fail_evt_t * msg
)
```

BGScript Functions

```
event sm_bonding_fail(handle, result)
```

Copyright © 2001-2012 Bluegiga Technologies

Bond Status

Bond status information

Table 184: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x04	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x04	method	Message ID
4	**uint8**	**bond**	Bond handle
5	**uint8**	**keysize**	Encryption key size used in long-term key
6	**uint8**	**mitm**	Was mitm used in pairing
7	**uint8**	**keys**	Keys stored for bond see:[enum sm_bonding_key]

C Functions

```
/* Callback */
struct ble_msg_sm_bond_status_evt_t{
    uint8 bond,
    uint8 keysize,
    uint8 mitm,
    uint8 keys
}
void ble_evt_sm_bond_status(
    const struct ble_msg_sm_bond_status_evt_t * msg
)
```

BGScript Functions

```
event sm_bond_status(bond, keysize, mitm, keys)
```

Copyright © 2001-2012 Bluegiga Technologies

Passkey Display

Passkey to be entered to remote device

Table 185: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x05	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x02	method	Message ID
4	**uint8**	**handle**	Bluetooth connection handle
5 - 8	**uint32**	**passkey**	Passkey range 000000-999999

C Functions

```
/* Callback */
struct ble_msg_sm_passkey_display_evt_t{
    uint8 handle,
    uint32 passkey
}
void ble_evt_sm_passkey_display(
    const struct ble_msg_sm_passkey_display_evt_t * msg
)
```

BGScript Functions

```
event sm_passkey_display(handle, passkey)
```

Copyright © 2001-2012 Bluegiga Technologies

Passkey Request

Security Manager requests user to enter passkey

Use Passkey Entry - command to respond to request

Table 186: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x01	lolen	Minimum payload length
2	0x05	class	Message class: Security Manager
3	0x03	method	Message ID
4	**uint8**	**handle**	Connection handle

C Functions

```
/* Callback */
struct ble_msg_sm_passkey_request_evt_t{
    uint8 handle
}
void ble_evt_sm_passkey_request(
    const struct ble_msg_sm_passkey_request_evt_t * msg
)
```

BGScript Functions

```
event sm_passkey_request(handle)
```

Copyright © 2001-2012 Bluegiga Technologies

5.8 System

The System class provides access to the local device and contains functions for example to query Bluetooth address, firmware version, packet counters etc.

5.8.1 Commands

System class commands

Address Get

This command reads the local devices public Bluetooth address.

Table 187: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x02	method	Message ID

Table 188: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x06	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x02	method	Message ID
4 - 9	**bd_addr**	**address**	Bluetooth address of the local device

C Functions

```
/* Function */
void ble_cmd_system_address_get(
    void
);

/* Callback */
struct ble_msg_system_address_get_rsp_t{
    bd_addr address
}
void ble_rsp_system_address_get(
    const struct ble_msg_system_address_get_rsp_t * msg
)
```

BGScript Functions

```
call system_address_get()(address)
```

Copyright © 2001-2012 Bluegiga Technologies

Endpoint Rx

Read data from an endpoint (i.e., data souce, e.g., UART), error is returned if endpoint does not have enough data.

Table 189: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0D	method	Message ID
4	**uint8**	**endpoint**	Endpoint index to read data from
5	**uint8**	**size**	Size of data to read

Table 190: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0D	method	Message ID
4 - 5	**uint16**	**result**	Command result
6	**uint8array**	**data**	Data read from endpoint

C Functions

```
/* Function */
void ble_cmd_system_endpoint_rx(
    uint8 endpoint,
    uint8 size
);

/* Callback */
struct ble_msg_system_endpoint_rx_rsp_t{
    uint16 result,
    uint8 data_len,
    const uint8* data_data
}
void ble_rsp_system_endpoint_rx(
    const struct ble_msg_system_endpoint_rx_rsp_t * msg
)
```

BGScript Functions

```
call system_endpoint_rx(endpoint, size)(result, data_len, data_data)
```

Copyright © 2001-2012 Bluegiga Technologies

Endpoint Set Watermarks

Set watermarks on both input and output sides of an endpoint. This is used to enable and disable the following events: system_endpoint_watermark_tx and system_endpoint_watermark_rx

Table 191: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x03	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0E	method	Message ID
4	**uint8**	**endpoint**	Endpoint index to set watermarks.
5	**uint8**	**rx**	Watermark position on receive buffer **0xFF** : watermark is not modified **0** : disables watermark
6	**uint8**	**tx**	Watermark position on transmit buffer **0xFF** : watermark is not modified **0** : disables watermark

Table 192: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0E	method	Message ID
4 - 5	**uint16**	**result**	Command result

C Functions

```
/* Function */
void ble_cmd_system_endpoint_set_watermarks(
    uint8 endpoint,
    uint8 rx,
    uint8 tx
);

/* Callback */
struct ble_msg_system_endpoint_set_watermarks_rsp_t{
    uint16 result
}
void ble_rsp_system_endpoint_set_watermarks(
    const struct ble_msg_system_endpoint_set_watermarks_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call system_endpoint_set_watermarks(endpoint, rx, tx)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Endpoint Tx

Send data to endpoint, error is returned if endpoint does not have enough space

Table 193: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x09	method	Message ID
4	**uint8**	**endpoint**	Endpoint index to send data to
5	**uint8array**	**data**	data to send

Table 194: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x09	method	Message ID
4 - 5	**uint16**	**result**	Command result

C Functions

```
/* Function */
void ble_cmd_system_endpoint_tx(
    uint8 endpoint,
    uint8 data_len,
    const uint8* data_data
);

/* Callback */
struct ble_msg_system_endpoint_tx_rsp_t{
    uint16 result
}
void ble_rsp_system_endpoint_tx(
    const struct ble_msg_system_endpoint_tx_rsp_t * msg
)
```

BGScript Functions

```
call system_endpoint_tx(endpoint, data_len, data_data)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Get Connections

This command reads the number of supported connections from the local device.

Table 195: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x06	method	Message ID

Table 196: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x01	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x06	method	Message ID
4	**uint8**	**maxconn**	Max supported connections

Table 197: EVENTS

Event	Description
connection status	Connection status for each connection handle

C Functions

```
/* Function */
void ble_cmd_system_get_connections(
    void
);

/* Callback */
struct ble_msg_system_get_connections_rsp_t{
    uint8 maxconn
}
void ble_rsp_system_get_connections(
    const struct ble_msg_system_get_connections_rsp_t * msg
)
```

BGScript Functions

```
call system_get_connections()(maxconn)
```

Copyright © 2001-2012 Bluegiga Technologies

Get Counters

Read packet counters and resets them, also returns available packet buffers.

Table 198: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x05	method	Message ID

Table 199: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x05	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x05	method	Message ID
4	**uint8**	**txok**	Acknowledgements received for sent packets
5	**uint8**	**txretry**	Number of packets retransmitted
6	**uint8**	**rxok**	packets received where crc was ok
7	**uint8**	**rxfail**	packets received where crc failed
8	**uint8**	**mbuf**	Available packet buffers

C Functions

```
/* Function */
void ble_cmd_system_get_counters(
    void
);

/* Callback */
struct ble_msg_system_get_counters_rsp_t{
    uint8 txok,
    uint8 txretry,
    uint8 rxok,
    uint8 rxfail,
    uint8 mbuf
}
void ble_rsp_system_get_counters(
    const struct ble_msg_system_get_counters_rsp_t * msg
)
```

BGScript Functions

```
call system_get_counters()(txok, txretry, rxok, rxfail, mbuf)
```

Get Info

This command reads the local devices software and hardware versions.

Table 200: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x08	method	Message ID

Table 201: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x0C	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x08	method	Message ID
4 - 5	**uint16**	**major**	Major software version
6 - 7	**uint16**	**minor**	Minor software version
8 - 9	**uint16**	**patch**	Patch ID
10 - 11	**uint16**	**build**	Build version
12 - 13	**uint16**	**ll_version**	Link layer version
14	**uint8**	**protocol_version**	BGAPI protocol version
15	**uint8**	**hw**	Hardware version

C Functions

```
/* Function */
void ble_cmd_system_get_info(
    void
);

/* Callback */
struct ble_msg_system_get_info_rsp_t{
    uint16 major,
    uint16 minor,
    uint16 patch,
    uint16 build,
    uint16 ll_version,
    uint8 protocol_version,
    uint8 hw
}
void ble_rsp_system_get_info(
    const struct ble_msg_system_get_info_rsp_t * msg
)
```

Copyright © 2001-2012 Bluegiga Technologies

BGScript Functions

```
call system_get_info()(major, minor, patch, build, ll_version,
protocol_version, hw)
```

Hello

This command can be used to test if the local device is functional. Similar to a typical "AT" -> "OK" test.

Table 202: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x01	method	Message ID

Table 203: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: response
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x01	method	Message ID

C Functions

```
/* Function */
void ble_cmd_system_hello(
    void
);

/* Callback *
void ble_rsp_system_hello(
    const void *nul
)
```

BGScript Functions

```
call system_hello()
```

Copyright © 2001-2012 Bluegiga Technologies

Reset

This command resets the local device immediately. The command does not have a response.

Table 204: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x01	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x00	method	Message ID
4	**uint8**	**boot_in_dfu**	Selects the boot mode **0 : boot to main program** **1 : boot to DFU**

Table 205: EVENTS

Event	Description
system boot	Sent when device has completed reset

C Functions

```
/* Function */
void ble_cmd_system_reset(
    uint8 boot_in_dfu
);
```

BGScript Functions

```
call system_reset(boot_in_dfu)
```

Copyright © 2001-2012 Bluegiga Technologies

Whitelist Append

Add an entry to the running white list defining the remote devices which are allowed to establish a connection. If list is empty, calls from all devices will be accepted. Do not use this command while advertising or while being connected. The current list is discarded upon reset or power-cycle.

Table 206: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x07	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0A	method	Message ID
4 - 9	**bd_addr**	**address**	Bluetooth device address to add to the running white list
10	**uint8**	**address_type**	Bluetooth address type

Table 207: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0A	method	Message ID
4 - 5	**uint16**	**result**	

C Functions

```
/* Function */
void ble_cmd_system_whitelist_append(
    bd_addr address,
    uint8 address_type
);

/* Callback */
struct ble_msg_system_whitelist_append_rsp_t{
    uint16 result
}
void ble_rsp_system_whitelist_append(
    const struct ble_msg_system_whitelist_append_rsp_t * msg
)
```

BGScript Functions

```
call system_whitelist_append(address, address_type)(result)
```

Copyright © 2001-2012 Bluegiga Technologies

Whitelist Clear

Delete alll entries of the white list at once. Do not use this command while advertising or while being connected.

Table 208: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0C	method	Message ID

Table 209: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0C	method	Message ID

C Functions

```
/* Function */
void ble_cmd_system_whitelist_clear(
    void
);

/* Callback *
void ble_rsp_system_whitelist_clear(
    const void *nul
)
```

BGScript Functions

```
call system_whitelist_clear()
```

Copyright © 2001-2012 Bluegiga Technologies

Whitelist Remove

Remove an entry from the running white list. Do not use this command while advertising or while being connected.

Table 210: COMMAND

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x07	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0B	method	Message ID
4 - 9	**bd_addr**	**address**	Bluetooth device address to remove from the running white list
10	**uint8**	**address_type**	Bluetooth address type

Table 211: RESPONSE

Byte	Type	Name	Description
0	0x00	hilen	Message type: command
1	0x02	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x0B	method	Message ID
4 - 5	**uint16**	**result**	

C Functions

```
/* Function */
void ble_cmd_system_whitelist_remove(
    bd_addr address,
    uint8 address_type
);

/* Callback */
struct ble_msg_system_whitelist_remove_rsp_t{
    uint16 result
}
void ble_rsp_system_whitelist_remove(
    const struct ble_msg_system_whitelist_remove_rsp_t * msg
)
```

BGScript Functions

```
call system_whitelist_remove(address, address_type)(result)
```

5.8.2 Enumerations

System class enumerations

Endpoints

Data Endpoints used in data routing and interface configuration

Table 212: VALUES

Value	Name	Description
0	system_endpoint_api	Command Parser
1	system_endpoint_test	Radio Test
2	system_endpoint_script	BGScript (not used)
3	system_endpoint_usb	USB Interface
4	system_endpoint_uart0	USART 0
5	system_endpoint_uart1	USART 1

Copyright © 2001-2012 Bluegiga Technologies

5.8.3 Events

System class events

Boot

This event is produced when the device boots up and is ready to receive commands

This event is not sent over USB interface.

Table 213: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x0C	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x00	method	Message ID
4 - 5	**uint16**	**major**	Major software version
6 - 7	**uint16**	**minor**	Minor software version
8 - 9	**uint16**	**patch**	Patch ID
10 - 11	**uint16**	**build**	Build version
12 - 13	**uint16**	**ll_version**	Link layer version
14	**uint8**	**protocol_version**	BGAPI protocol version
15	**uint8**	**hw**	Hardware version

C Functions

```
/* Callback */
struct ble_msg_system_boot_evt_t{
    uint16 major,
    uint16 minor,
    uint16 patch,
    uint16 build,
    uint16 ll_version,
    uint8 protocol_version,
    uint8 hw
}
void ble_evt_system_boot(
    const struct ble_msg_system_boot_evt_t * msg
)
```

BGScript Functions

```
event system_boot(major, minor, patch, build, ll_version, protocol_version,
hw)
```

Copyright © 2001-2012 Bluegiga Technologies

Endpoint Watermark Rx

This event is generated if the receive (incoming) buffer of the endpoint has been filled with a number of bytes equal or higher than the value defined by the command system_endpoint_set_watermarks.Data from the receive buffer can be read with the command system_endpoint_rx.

Table 214: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x02	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x02	method	Message ID
4	**uint8**	**endpoint**	Endpoint index where data was received
5	**uint8**	**data**	Received data size

C Functions

```
/* Callback */
struct ble_msg_system_endpoint_watermark_rx_evt_t{
    uint8 endpoint,
    uint8 data
}
void ble_evt_system_endpoint_watermark_rx(
    const struct ble_msg_system_endpoint_watermark_rx_evt_t * msg
)
```

BGScript Functions

```
event system_endpoint_watermark_rx(endpoint, data)
```

Copyright © 2001-2012 Bluegiga Technologies

Endpoint Watermark Tx

This event is generated when the transmit (outgoing) buffer of the endpoint has free space for a number of bytes equal or higher than the value defined by the command system_endpoint_set_watermarks. When free space is enough, data can be sent out of the endpoint by the command system_endpoint_tx.

Table 215: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x02	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x03	method	Message ID
4	**uint8**	**endpoint**	Endpoint index where data was sent
5	**uint8**	**data**	Space available

C Functions

```
/* Callback */
struct ble_msg_system_endpoint_watermark_tx_evt_t{
    uint8 endpoint,
    uint8 data
}
void ble_evt_system_endpoint_watermark_tx(
    const struct ble_msg_system_endpoint_watermark_tx_evt_t * msg
)
```

BGScript Functions

```
event system_endpoint_watermark_tx(endpoint, data)
```

Copyright © 2001-2012 Bluegiga Technologies

No License Key

No valid license key found

Table 216: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x00	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x05	method	Message ID

C Functions

```
/* Callback *
void ble_evt_system_no_license_key(
    const void *nul
)
```

BGScript Functions

```
event system_no_license_ke)
```

Copyright © 2001-2012 Bluegiga Technologies

Script Failure

Script failure detected

Table 217: EVENT

Byte	Type	Name	Description
0	0x80	hilen	Message type: event
1	0x04	lolen	Minimum payload length
2	0x00	class	Message class: System
3	0x04	method	Message ID
4 - 5	**uint16**	**address**	Address where failure was detected
6 - 7	**uint16**	**reason**	Reason for failure

C Functions

```
/* Callback */
struct ble_msg_system_script_failure_evt_t{
    uint16 address,
    uint16 reason
}
void ble_evt_system_script_failure(
    const struct ble_msg_system_script_failure_evt_t * msg
)
```

BGScript Functions

```
event system_script_failure(address, reason)
```

5.9 Error Codes

This section describes the error codes the API commands may produce.

5.9.1 BGAPI Errors

Errors related to BGAPI protocol

Invalid Parameter (0x0180)

Command contained invalid parameter

Device in Wrong State (0x0181)

Device is in wrong state to receive command

Out Of Memory (0x0182)

Device has run out of memory

Copyright © 2001-2012 Bluegiga Technologies

Feature Not Implemented (0x0183)

Feature is not implemented

Command Not Recognized (0x0184)

Command was not recognized

Timeout (0x0185)

Command or Procedure failed due to timeout

Not Connected (0x0186)

Connection handle passed is to command is not a valid handle

flow (0x0187)

Command would cause either underflow or overflow error

User Attribute (0x0188)

User attribute was accessed through API which is not supported

Invalid License Key (0x0189)

No valid license key found

5.9.2 Bluetooth Errors

Bluetooth errors

Authentication Failure (0x0205)

Pairing or authentication failed due to incorrect results in the pairing or authentication procedure. This could be due to an incorrect PIN or Link Key

Pin or Key Missing (0x0206)

Pairing failed because of missing PIN, or authentication failed because of missing Key.

Copyright © 2001-2012 Bluegiga Technologies

Memory Capacity Exceeded (0x0207)

Controller is out of memory.

Connection Timeout (0x0208)

Link supervision timeout has expired.

Connection Limit Exceeded (0x0209)

Controller is at limit of connections it can support.

Command Disallowed (0x020C)

Command requested cannot be executed because the Controller is in a state where it cannot process this command at this time.

Invalid Command Parameters (0x0212)

Command contained invalid parameters.

Remote User Terminated Connection (0x0213)

User on the remote device terminated the connection.

Connection Terminated by Local Host (0x0216)

Local device terminated the connection.

LL Response Timeout (0x0222)

Connection terminated due to link-layer procedure timeout.

LL Instant Passed (0x0228)

Received link-layer control packet where instant was in the past.

Controller Busy (0x023A)

Operation was rejected because the controller is busy and unable to process the request.

Directed Advertising Timeout (0x023C)

Directed advertising completed without a connection being created.

MIC Failure (0x023D)

Connection was terminated because the Message Integrity Check (MIC) failed on a received packet.

Connection Failed to be Established (0x023E)

LL initiated a connection but the connection has failed to be established. Controller did not receive any packets from remote end.

5.9.3 Security Manager Protocol Errors

Errors from Security Manager Protocol

Copyright © 2001-2012 Bluegiga Technologies

Passkey Entry Failed (0x0301)

The user input of passkey failed, for example, the user cancelled the operation

OOB Data is not available (0x0302)

Out of Band data is not available for authentication

Authentication Requirements (0x0303)

The pairing procedure cannot be performed as authentication requirements cannot be met due to IO capabilities of one or both devices

Confirm Value Failed (0x0304)

The confirm value does not match the calculated compare value

Pairing Not Supported (0x0305)

Pairing is not supported by the device

Encryption Key Size (0x0306)

The resultant encryption key size is insufficient for the security requirements of this device

Command Not Supported (0x0307)

The SMP command received is not supported on this device

Unspecified Reason (0x0308)

Pairing failed due to an unspecified reason

Copyright © 2001-2012 Bluegiga Technologies

Repeated Attempts (0x0309)

Pairing or authentication procedure is disallowed because too little time has elapsed since last pairing request or security request

Invalid Parameters (0x030A)

The Invalid Parameters error code indicates: the command length is invalid or a parameter is outside of the specified range.

5.9.4 Attribute Protocol Errors

Errors from Attribute Protocol

Invalid Handle (0x0401)

The attribute handle given was not valid on this server

Read Not Permitted (0x0402)

The attribute cannot be read

Write Not Permitted (0x0403)

The attribute cannot be written

Copyright © 2001-2012 Bluegiga Technologies

Invalid PDU (0x0404)

The attribute PDU was invalid

Insufficient Authentication (0x0405)

The attribute requires authentication before it can be read or written.

Request Not Supported (0x0406)

Attribute Server does not support the request received from the client.

Invalid Offset (0x0407)

Offset specified was past the end of the attribute

Insufficient Authorization (0x0408)

The attribute requires authorization before it can be read or written.

Prepare Queue Full (0x0409)

Too many prepare writes have been queueud

Attribute Not Found (0x040A)

No attribute found within the given attribute handle range.

Attribute Not Long (0x040B)

The attribute cannot be read or written using the Read Blob Request

Insufficient Encryption Key Size (0x040C)

The Encryption Key Size used for encrypting this link is insufficient.

Invalid Attribute Value Length (0x040D)

The attribute value length is invalid for the operation

Unlikely Error (0x040E)

The attribute request that was requested has encountered an error that was unlikely, and therefore could not be completed as requested.

Insufficient Encryption (0x040F)

The attribute requires encryption before it can be read or written.

Unsupported Group Type (0x0410)

The attribute type is not a supported grouping attribute as defined by a higher layer specification.

Insufficient Resources (0x0411)

Insufficient Resources to complete the request

Copyright © 2001-2012 Bluegiga Technologies

Application Error Codes (0x0480)

Application error code defined by a higher layer specification.

Copyright © 2001-2012 Bluegiga Technologies
